Meeting the challenges of modern train management systems
Modern trains are equipped with an increasing number of intelligent sub-systems to cope with the demands for improved performance, safety, energy efficiency and comfort. This evolution brings a number of challenges to train manufacturers, operators and system integrators. For instance, the lack of interoperability and integration between the different sub-systems may lead to a complicated system architecture and various technical challenges.

We can say that the higher the number of separate sub-systems on-board, the higher the costs for train design, manufacturing, operation, maintenance and refurbishment.

EKE developed Trainnet® to be a versatile and comprehensive answer to all these challenges. Trainnet® is what we would like to call a “Super TCMS”, a Train Control and Management System that is fully capable of integrating all communication and safety enhancing systems such as PIS/PA, Event Recorders, HMI, GPS, 3G/WIFI and CCTV.

The Trainnet® TCMS can interact with other on-board sub-system and provide you with additional features such as centralized control and diagnostics. The idea behind Trainnet® is to provide a single platform for the integration and automation of all train-borne intelligent systems.

The Trainnet® concept enables us to offer an open, flexible, and cost-effective solution for any train. We provide you with turnkey integration services making your life easier.
Contents

Products

The product section presents EKE’s technologies for train automation, system integration, onboard communication and increased safety. All the products are part of the Trainnet® family and use the same modular platform for maximum freedom and synergy.

Applications

The application section gives some examples of functions and developments possible with Trainnet® products. It covers safety applications as well as Software for improved train management and operations.

30 Automation Applications
31 Mobile Applications
32 Safety Integrity Level (sIL)
33 Monitoring of axle box bearing temperature
34 Lateral Acceleration Monitoring (LAM)
35 Vigilance Control System (VCS)
36 SmartVision™ (frcms)
38 AutomaticSelective Door Operating system (ASDO)
The module section provides advanced technical information about most commonly used Trainnet® modules: please contact us for further needs. Please note Trainnet® modules can only be used as part of Trainnet® Products.

**Central Processing Units (cpu)**
- 40 Central Processing Unit with Graphical Display Controller (cpg)
- 41 Central Processing Unit with Serial Links (cps, cpf)
- 42 CPU with Serial Links and GPS (cps-gps, cpf-gps)
- 43 Central Processing Unit with Ethernet Bus (cpe)

**Train and Vehicle Bus Interface Modules**
- 44 Onboard Mobile Gateway (omg)
- 45 Wire Train Bus Interface Module (wtb, wtf)
- 46 Multifunction Vehicle Bus Interface Module (mvb)
- 47 CAN Vehicle Bus Interface Module (cvb)
- 48 Serial Links Interface Unit (siu)
- 49 Ethernet Router Unit (eru)
- 50 Compact Ethernet Switching Unit (3u esu)
- 51 Ethernet Switching Unit with PoE (3u esu poe)
- 52 Unmanaged Ethernet Switching Unit (um-esu)
- 53 Ethernet Switching Unit (1u esu)

**Input/Output Modules**
- 54 Analogue Input Module (aim)
- 55 High Speed Analogue Input Module (hsa)
- 56 Analogue Output Module (aom)
- 57 Digital Input/Output Module (dio)
- 58 Digital Relay Output Module (dro)
- 59 Pt100 Temperature Sensor Input Module (pt1)

**Power Supplies**
- 60 Power Supply Unit for VME (psv)
- 61 Power Input Unit (piu, viu)
- 62 Compact Power Supply Unit (psr)
- 63 Power Supply Over Ethernet Module (pse)

**Rugged Memory Module (rmm)**

**Racks**
- 65 Standard Racks
- 66 Flat Racks
Technology for smarter trains

EKE provides leading technologies to train manufacturers, operators and integrators for improved train manufacturing and operations.

We provide tailored solutions for system integration, train automation, train communications and improved safety. We have solutions for high speed trains, commuter trains, metros, trams, passenger coaches and locomotives. We are the experts for Train Control and Management Systems (TCMS), Train Communication Networks (TCN), Vehicle Control Units (VCU), Gateways, Ethernet Train Backbones (ETB), Ethernet Switches and Event Recorders. Our expertise ranges from developing complete turnkey solutions to providing specific Hardware and Software products. We can also provide training, tools and guidance to support your own developments.

EKE is IRIS certified and our products comply with the International Railway Industry Standards such as EN 50155.

INTEGRATION
Integrate on-board systems via an efficient and versatile Train Communication Network (TCN). Hybrid networks are also supported.

AUTOMATION
Automate operations and diagnostics by developing a powerful Train Control and Management System (TCMS).

COMMUNICATION
Communicate with passengers and staff in the train and beyond via displays, audio announcements and wireless technologies.

SAFETY
Improve safety with our SIL technology, redundancies and safety enhancing systems such as Event Recorders and video surveillance.
Our promises

PERFORMANCE
- Most advanced technology…
  … that works together with older technology!
- Improved train operation reliability and safety
- Improved comfort and services to passengers

FLEXIBILITY
- Modular systems matching both your current and future needs
- Open platform and open standards for easy and unrestricted developments
- Integrate any system, even from third parties

COST EFFICIENCY
- Lower costs of design, installation and operation
- Faster diagnostics and maintenance to optimise train use
- Reduced cabling and weight with a more compact solution
Our references

EKE has 30 years of experience in Railways, working with high speed trains, commuter trains, metros, trams, passenger coaches and locomotives.

We have already installed tens of thousands of systems around the world and we continue to serve our customers with the highest quality and reliability.

Talgo AVRIL High Speed Train
TCMS with Train Communication Networks. Includes WTB, MVB, CAN, Ethernet, I/O modules as well as SIL-2 functionalities.

London Underground
TCMS, Driver display modules, Serial links to ATO, ATP, Train radio and brake controllers.

São Paulo Metro
Metro trains provided with TCMS, Train Communication Networks, PIS, CCTV, Video and Event Recorders (RMM).

Finnish Pendolino
Gateways, Brake diagnostics data transmission system, Speedometers, Displays and Event Recorders.
Some of our reference projects

We have worked with our customers on both new trains and refurbishment projects from the frosts of Finland to the heat of Australia.
Waratah Australia

We at EKE strive to push the boundaries of existing technologies in order to serve our customers with unparalleled safety, performance and cost-effectiveness. We designed the first Train Communication Network (TCN) fully based on Ethernet and industry standard IP-protocols for the Sydney Double-Deck Suburban Waratah Trains. 78 trains of 8 cars (624 cars) were equipped with Trainnet® systems between 2007 and 2012.

All sub-systems were integrated into the Trainnet® TCMS for comprehensive train control and diagnostics. Deliveries included TCMS, Driver Display Units (DDU), Guard Display Units (GDU), TCN (including Ethernet Switching Units with Power-over-Ethernet), Event Recorders with Rugged Memory Modules, an automated Passenger Information System and Radio link interfaces.
Products
Train Control and Management System (TCMS)

The Trainnet® TCMS improves train performance and safety while decreasing maintenance and operating costs.

The Trainnet® Train Control and Management System (TCMS) provides a single point of control over all train sub-systems. The TCMS enables control and monitoring over virtually any sub-system and function, for instance doors, brakes, PIS/PA and video surveillance, to name a few.

Using a unique control and management system allows for a simplified Train Communication Network (TCN). The train architecture becomes more efficient, thus saving on development and maintenance costs. In addition, the centralized TCMS is used to automate train operations and sub-system diagnostics, enabling increased reliability and quicker response times.

EFFICIENT INTEGRATION
The core of the Trainnet® TCMS is the Trainnet® Train Communication Network (TCN). The Trainnet® TCN is the infrastructure enabling the exchange of information throughout the train. It connects all the train sub-systems together via a common network (or several when requested), enabling centralized control.

In practice, the TCN consists of train computers, commonly referred to as Gateways, connected to each other as well as to train sub-systems. Trainnet® Gateways support multiple interface technologies including WTB, MVB, CAN, Serial Links and Ethernet. For more detailed information, please refer to the TCN and Gateway sections.

TRAIN AUTOMATION
The Trainnet® TCMS can be used to automate the train sub-systems. In most modern trains, on-board sub-systems generate a large quantity of data which is essential for safety (speed, braking, faults etc.) and operation purposes (system status, energy consumption, video recording etc.). The Trainnet® TCMS is able to gather this data, analyse it, and send logical commands and warnings. The information can be automatically exchanged between sub-systems and conveyed in real time to the train driver, the train captain, remotely located personnel and even passengers.

The Trainnet® TCMS is a versatile train computer which can be used in a number of applications such as:
- Diagnostics
- Automatic Train Inauguration
- PIS/PA system management
- Crew HMIs management
- Brakes and traction monitoring
- SIL and Safety Applications
- Fleet Management
- HVAC management
- Door management
- Lighting management
- CCTV system management
- Tank level monitoring
- Battery charge monitoring
- Train-to-wayside communication management

For more detailed descriptions of these applications, please refer to the Application Software section.

Trainnet® enables these applications to run on the same train computers that are used for Gateway functionalities, providing a more compact and cost-effective solution. Physically separated train computers can also be implemented, sometimes referred to as Vehicle Control Units (VCU).

Trainnet® systems provide all the necessary interfaces to connect with the sub-systems and the Train Communication Network.

Advantages

- **Versatility**
  Cover all your needs with a single system.

- **Modularity**
  Only pay for the features you need.

- **Open software**
  Keep control over your project at all times.

- **Long term support**
  Get support during the lifetime of your project.
Available technologies include a wide range of Bus Interface Modules (e.g. WTB, MVB, CAN, Serial Links and Ethernet) and Input/Output Interface Modules (Analogue Input, High Speed Analogue Input, Digital Input/Output, Digital Relay Output, Analogue Output, Pt-100 temperature Sensor Input). Remote Input/Output Modules (RIOM) are also available.

**MORE CONTROL**

The Trainnet® TCMS is a powerful and highly flexible system built on an open source software platform (Linux). You are free to develop your own applications as well as to integrate third party Hardware and Software onto the Trainnet® platform. With Trainnet®, you can develop your own applications using the ISaGRAF PLC Software. You can also develop applications as well make configuration modifications in C language, giving you full control. EKE has the expertise to develop all or a part of the Software for you, or alternatively provide training, tools and guidance to support your own developments. Finally, EKE can grant you the intellectual property rights (IPR) of the application Software in order to ensure you a safe, long-term investment.

On the Hardware side, the Trainnet® TCMS is modular. This means you can develop tailored systems matching your needs perfectly. By simply selecting the interfaces you need, you make sure the system answers all your demands while being cost-efficient. Systems can be easily upgraded with additional modules as needs arise.

**QUALITY AND RELIABILITY**

The outstanding quality and the unique design of Trainnet® products guarantee unparalleled reliability. Trainnet® products minimize the need for maintenance while maximizing train availability, providing a long-term cost benefit for operators. We provide support for more than 30 years in order to ensure that our customers are satisfied during the entire life-time of their project.

EKE is IRIS certified and Trainnet® complies with the railway industry standards, including the IEC 61375 series, IEC 61131 and EN 50155.
Train Communication Network (TCN)

Trainnet® TCN is a highly reliable Train Communication Network used all around the world. It complies with the IEC 61375 standard for TCNs.

**WHAT IS A TCN?**
A Train Communication Network (TCN) is the infrastructure enabling the exchange of information throughout the train. It usually consists of a Vehicle Bus for intra-vehicle communications and a Train Bus for train-wide information exchange. Traditionally the highly standardized WTB (Wire Train Bus) technology is used as a train bus and MVB (Multifunction Vehicle Bus) as a vehicle bus. Other bus technologies such as CAN and Serial Links are also widely used as vehicle buses. MVB or CAN can also be used to develop train-wide communication networks. The Ethernet bus technology (e.g. Ethernet Train Backbone, ETB) is a relative newcomer to be used as part of a TCN but has gained popularity in recent years, providing larger bandwidth and more flexible networks.

**EFFICIENT INTEGRATION**
There is often a lack of interoperability and harmonization between the different train sub-systems. Consequently, it is common to have several sub-systems within the train that use their own separate communication network and technologies. This leads to a complicated architecture and software as well as excess wiring. The development of a single, fully integrated system greatly simplifies train management system architecture and allows significant savings.

Trainnet® Train Communication Network enables the concurrent use of multiple bus technologies including Ethernet, WTB, MVB, CAN and Serial Links, making it suitable for both new trains and refurbishment projects. By selecting only the bus technologies that you need, you can develop a fully customized system and keep costs down. This versatility allows the deployment of a single integrated communication network across the train, connecting all the train sub-systems together. Multiple independent networks can of course be deployed if that is what your project requires.

The Trainnet® TCN provides efficient and reliable communication and data-routing between systems and different networks throughout the train as well as to the wayside. The information conveyed by the Trainnet® TCN can be accessed from any point on the network and even remotely (e.g. from depot). Redundancy can be implemented for additional reliability, with the possibility to use a different technology for the redundant path if required. Finally, the Trainnet® open Software (Linux) enables you to develop your own applications freely and keep control over your project at all times.

EKE also has the expertise to make all or a part of the Software for you, or alternatively provide training, tools and guidance to support your own developments. EKE can give you the intellectual property rights (IPR) of all applications Software to make sure you make a safe long-term investment.

**COMPARISON OF TRAIN BUS TECHNOLOGIES:**

</tbody>
</table>

*1Gbit/s is not standardized but technically available*
Example 1: Dynamic train configuration, no redundancy

Example 2: Dynamic train configuration, redundant train bus

Example 3: Fixed train configuration, fully redundant network

KEY APPLICATIONS

→ Redundancy
Building a redundant Train Communication Network (TCN) enables you to ensure continuous operations in case of a failure somewhere in the network. Where a single point of failure would disable the entire network (see Example 1), a redundant network provides alternative communication paths (see Example 3). Redundancy aims at eliminating single points of failure for flawless operations, even when malfunctions or breakdowns occur in the network. Implementing redundant networks helps preventing train immobilization and ensures availability of train functionalities at all time. Redundancy improves reliability and safety while saving costs in the long run.

→ Automatic Train Inauguration
Automatic Train Inauguration means that train consists can be connected, disconnected or switched without jeopardizing the train operations (Examples 1 and 2). Train configuration changes are automatically detected and the inauguration identify each car and its orientation thus enabling communications across the Train Communication Network. In the case of a fixed train set, the automatic inauguration may also be required in order to connect several trains together.

Trainnet® train bus technologies such as WTB and ETB (Ethernet Train Backbone) enable automatic inauguration. Even thought MVB does not allow automatic inauguration EKE has developed a solution to dynamically configure trains using MVB bus as backbone. When a completely fixed train set is used, a cost-effective train communication network can be built without a dynamic train bus (Example 3).

→ Decentralized Event Management
Trainnet® TCN technology enables you to build a centralized system with full control over the system from anywhere in the network. It is also able to keep key information and instructions spread over the network. Where in some systems, the applications and event logs are kept in a central computer, Trainnet® TCN allows for each car to run its own applications as well as logging its faults and alarms. It means that if one computer fails, the functionality and logs of the other coach computers are preserved.

QUALITY AND RELIABILITY
The outstanding quality and the unique design of Trainnet® products guarantee unparalleled reliability. Trainnet® products minimize the need for maintenance while maximizing train availability, providing a long-term cost benefit to operators. We provide support for more than 30 years in order to ensure that our customers are satisfied during the entire life-time of their project.

EKE is IRIS certified and Trainnet® complies with the railway industry standards, including the IEC 61375 series, IEC 61131 and EN 50155.

Advantages

Versatility
Cover all your needs with a single system.

Modularity
Only pay for the features you need.

Open software
Keep control over your project at all times.

Long term support
Get support during the lifetime of your project.
**TCN Gateways**

The Trainnet® TCN Gateways are advanced train computers used in the creation of efficient Train Communication Networks (TCN).

**MODULAR CONCEPT**
The Trainnet® TCN Gateways are modular, enabling you to precisely select the train bus and vehicle bus technologies you require. Modules can be freely combined for a very flexible and versatile solution. The modular design enables you to select only the features you need for a cost-efficient solution. It also means that repairs and upgrades are quick and easy.

A Trainnet® TCN Gateway usually consists of a Central Processing Unit (CPU), a power supply and at least one Bus Interface module. EKE has developed a comprehensive range of CPUs, power supplies and bus interface modules to accommodate most technical requirements and budgets. Please find below an example of a Gateway made of a selection of common modules.

**BUS INTERFACES**

Trainnet® TCN Gateways can combine some or all of the following train and vehicle bus technologies, as your needs require:

- **Wire Train Bus (WTB)**
The WTB interface usually has two DE-9 connectors with redundant lines integrated in each connector. A version with 4 connectors and one with fritting are available as options.

- **ETB (Ethernet Train Backbone)**
The Ethernet Train Backbone is implemented with the Trainnet® ERU module. The ERU module is an Ethernet Switch and Router providing 10 Ethernet ports, 4 of which are dedicated to the ETB (with redundant lines).

- **ECN (Ethernet Consist Network)**
An ECN can be used as vehicle bus but also as train bus in the

and many more modules to choose from (at the end of this brochure)
case of a fixed consist. Trainnet® Ethernet Switches (ERU, 3U ESU, 1U ESU, UM-ESU) can be used to create ECNs. Power-over-Ethernet is available as an option with the 1U ESU modules to provide power to connected sub-systems via the Ethernet cables.

- **Multifunction Vehicle Bus (MVB)**
The MVB physical medium can be ESD+ or EMD. ESD+ and EMD have two DE-9 connectors with redundant lines integrated into each connector.

- **CAN Vehicle Bus (CVB)**
The Trainnet® CAN module has two DE-9 connectors and is used to create up to two CAN buses. The 2 CAN ports can be independently configured as CAN 2.0 A/B or CANopen®.

- **Serial Links (S/L)**
Serial Links interfaces can be used to create Vehicle Buses even though they are commonly used for direct connection to sub-systems. The physical layers RS-485 and RS-422 are supported. Modbus and customized protocols can be used.

Please contact us to discuss which architecture and modules meet best your requirements.

- **RACKS**
The Trainnet® TCN Gateways are usually provided as fully integrated systems, fitting in either 44TE or 84TE wide rack. The rack height is typically 3U or 6U. Other rack sizes like 20TE are also available: please ask us.

- **MORE THAN A GATEWAY**
Other modules such as Event Recorders and Discrete Input and Output modules can also be integrated into the same rack to build a compact and cost-efficient train computer or TCMS.

- **SUPPORT**
EKE provides at least 30 years of support for all Trainnet® products.

- **TECHNICAL SPECIFICATIONS**

  **Dimensions (W x H x D)**
  - 3U 44TE Rack: 280 mm x 133 mm x 215 mm (Installation width 240 mm)
  - 3U 84TE Rack: 483 mm x 133 mm x 215 mm (Installation width 443 mm)
  - 6U 84TE Rack: 483 mm x 266 mm x 215 mm (Installation width 443 mm)

  **Weight**
  Depends on rack and installed modules

  **Input Voltage**
  24, 36, 48, 52, 72 or 110 V DC

  **Temperature Range (operational)**
  -40 °C...+70 °C

  **MTBF (40 °C ambient temperature)**
  Depends on installed modules

  **Interface Options:**
  WTB, MVB, CAN, Ethernet, Serial Links

  Read Module pages for more details.
The Trainnet® Vehicle Control Unit (VCU) is a powerful computer for train automation. The Trainnet® VCU can carry out advanced control and diagnostic functions. The Trainnet® VCU can control any train sub-system such as brakes or doors. It can be used for both physical control (e.g. opening/closing/locking the doors, activate heating/cooling/ventilation etc.) and diagnostics (e.g. checking the proper closing of a door, monitoring brake temperature etc.) of train sub-systems. Please find below common applications:

- Diagnostics
- PIS/PA system management
- Crew HMIs management
- Brakes and traction monitoring
- S&L and Safety Applications
- Fleet Management
- HVAC management
- Door management
- Lighting management
- CCTV system management
- Tank level monitoring
- Battery charge monitoring
- Train-to-wayside communication management

Trainnet® enables these control and diagnostic applications to run on the same train computers that are used for Gateway functionalities, providing a more compact and cost-effective solution. Physically separated Gateways can also be implemented.

KEY FEATURES
The Trainnet® VCU can connect with sub-systems and the Train Communication Network. Available interfaces include a wide range of bus technologies (e.g. WTB, MVB, CAN, Serial Links and Ethernet) and Input/Output Interface Modules (Analogue Input, High Speed Analogue Input, Digital Input/Output, Digital Relay Output, Analogue Output, Pt-100 temperature Sensor Input). Remote Input/Output Modules (RIOM) are also available.

MORE CONTROL
The Trainnet® VCU is a powerful and highly flexible system built on an open source software platform (Linux). You are free to develop your own applications as well as to integrate third party Hardware and Software onto the Trainnet® platform. With Trainnet®, you can develop your own applications using the ISaGRAF PLC Software. You can also develop applications and make configuration modifications in C language, giving you full control. EKE has the expertise to develop all or a part of the Software for you, or alternatively provide training, tools and guidance to support your own developments. Finally, EKE can grant you the intellectual property rights (IPR) of the application Software in order to ensure you a safe, long-term investment.

On the Hardware side, the Trainnet® VCU is modular. This means you can develop tailored systems matching your needs perfectly. By simply selecting the interfaces you need, you make sure the system answers all your demands while being cost-efficient. Systems can be easily upgraded with additional modules as needs arise.

SUPPORT
EKE provides support for at least 30 years for all Trainnet® products.

Technical Specifications

- Dimensions (W x H x D)
  - 3U 44TE Rack
    280 mm x 133 mm x 215 mm
    (installation width 240 mm)
  - 3U BATE Rack
    483 mm x 133 mm x 215 mm
    (installation width 443 mm)
  - 6U BATE Rack
    483 mm x 266 mm x 215 mm
    (installation width 443 mm)
- Weight
  Depends on installed modules
- Input Voltage
  24, 36, 48, 52, 72 or 110 V DC
- Temperature Range (operational)
  -40 ºC ... +70 ºC
- MTBF (40 ºC ambient temperature)
  Depends on installed modules
- Interface Options:
Remote Input/Output Module (ETHERNET RIOM, MVB RIOM)

FUNCTIONS
The Trainnet® RIOM enables data input and output within the vicinity of the I/O sources. It is used as an alternative to connecting I/O sources directly to the train computer (e.g. VCU) and it can lead to reduced cabling and thus cost savings.

KEY FEATURES
The RIOM supports both analogue and digital inputs/outputs. Most Trainnet® I/O module can be used, including AIM, AOM, DIO, DRO and PTI. You can find out more about these modules by reading the dedicated datasheets or by contacting a Sales representative at EKE.

The Trainnet® RIOM includes an interface module used for the communications with the train computer. It is also equipped with an independent power supply (Trainnet® PSR module).

OPTIONS
Interfaces:
- The Trainnet® Ethernet RIOM is equipped with one Ethernet interface for connectivity with the train computer (CPE module).
- The Trainnet® MVB RIOM uses MVB interfaces to connect with the train computer.

By default, the MVB physical interface is Electrical Medium Distance (EMD) with two sub D-9 connectors. Electrical Short Distance with optical isolation (ESD+) mediums are available upon request.

Number of modules:
- In its most compact version, RIOM can use up to 8 EKE Trainnet® I/O modules and be fitted into a 44TE rack.
- An 84TE rack version is also available as an option to fit up to 18 I/O modules.

TECHNICAL SPECIFICATIONS

Dimensions (W x H x D)
- 3U 44TE Rack: 280 mm x 133 mm x 215 mm (installation width 240 mm)
- 3U 84TE Rack: 483 mm x 133 mm x 215 mm (installation width 443 mm)

Weight
- 44TE option: 2.6 Kg (+ I/O module weights)
- 84TE option: 4 Kg (+ I/O module weights)

Input Power
- 24…36 V DC -30/+25% or 48…110 V DC -30/+25%

Temperature Range (operational)
- -40 ºC…+70 ºC

MTBF (40 ºC ambient temperature)
- Depends on installed I/O modules

Interface options
- Ethernet RIOM: 1 x 10/100 Mbit/s M12
- MVB RIOM: Electrical Medium Distance (EMD) with two sub D-9 connectors (Isolated Electrical Short Distance (ESD) physical interface upon request)
EKE is a pioneer in Ethernet based Train Communication Networks (TCN). Trainnet® Switches and Software were used on board the first train with 100% IP-based TCN.

**FUNCTIONS**

Depending on the Ethernet modules that you select, the following functions can be achieved:

- **Ethernet Train Backbone (ETB)**
  The Ethernet Train Backbone (ETB) is a modern train bus technology enabling a cost-effective setup with a large bandwidth (up to 100Mbit/s Vs 1 Mbit/s for WTB). It can replace or be used together with WTB and other train buses. Like the WTB, it allows for dynamic train configuration.

- **Ethernet Consist Network (ECN)**
  The Ethernet Consist Network (ECN) technology can be used to create vehicle buses and also as train-wide communication network in the case of fixed consist (no dynamic train configuration).

- **Ethernet Switch**
  Ethernet Switches are used to connect devices to the Train Communication Network enabling networked devices to communicate with each other. A managed switch manages layer 3 protocols, such as DHCP and IGMP. It also allows for finer configuration of the switch. When the switch is unmanaged, that functionality must be implemented by a connected device (managed switch or CPU).

- **Ethernet Router**
  The routing functionality allows the switch to be dynamically configured, thus redirecting messages to devices based on the latest information. A common application is dynamic train configuration: when changing the order of cars, the train communication network is automatically reconfigured. The position and orientation of each car is identified, enabling flawless communications throughout the train.

- **Power-over-Ethernet (PoE)**
  Power-over-Ethernet allows for the passing of electrical power in addition to data with Ethernet cabling.
It means you can dramatically reduce setup costs and wiring as only one cable is required to each device. More and more devices support PoE including surveillance cameras, displays, GSM antennas, emergency phones etc.

**MODULARITY**
The Trainnet® Systems are modular. You can build an Ethernet Switch with just the functionalities you need, for cost-efficiency. As a general rule, a standalone Trainnet® Ethernet Switch includes a Trainnet® Rack, a Trainnet® power supply and at least one Trainnet® Ethernet Module.

Trainnet® Ethernet Switches can be easily integrated into a more comprehensive Trainnet® system. For instance, the Ethernet Switch can be used as part of a Gateway, a VCU or a full TCMS train computer. That way, you are able to save space and money with a very compact and efficient system.

**RACKS**
The Trainnet® Racks are available in different sizes: the most common are 20TE, 44TE and 84TE wide racks. The racks are usually 3U high but a 6U 84TE Rack is also available for larger systems as well as for the Trainnet® 1U ESU Switch with Power-over-Ethernet. Other rack sizes are also available: please ask us.

**POWER SUPPLY**
Most Trainnet® Systems can be powered using the Trainnet® PSV and Trainnet® PIU modules. When Power-over-Ethernet is needed, the Trainnet® PSE, Trainnet® ESS and optionally the Trainnet® PBU are used.

**Event Recorders**

**FUNCTIONS**
A Trainnet® Event Recorder (ER) is an on-board data recorder for collecting and storing vital train-borne information. The Trainnet® Event Recorder can record all kinds of data including audio and video streams.

**KEY FEATURES**
The Trainnet® Event Recorders are able to record virtually any available signals, analogue or digital. The Event Recorder can be programmed to record safety critical information like train speed, train position or brake temperature. The Event Recorder can also record video streams from onboard digital video recorders (DVR) or directly from the cameras. For easy data retrieval, the stream format can be made compatible with your CCTV Software or any other video analysis Software that you are using. Alternatively, we can develop customized video analysis tools to fit your needs.

</tbody>
</table>
and the USB port can be used to download the data stored in the recorder. Alternatively, the Ethernet port can be used to connect to a sub-system or an Ethernet Switch. The RS-485 port can also be connecting sub-systems.

All the Trainnet® Event Recorders are protected against shocks, vibration, humidity, temperature variations, excessive emissions and excessive voltages (follows the EN50155 standard). Front-panel imprints are available upon request.

**MODULARITY**

Additional interfaces can be easily added to the Event Recorder, as the system is modular. You can add bus interfaces such as MVB, CAN, S/L or Ethernet to connect with train sub-systems or Train Communication Network (TCN) in order to acquire data. You can also add Input/Output Interfaces to record various signals. Available I/O Interface Modules include Analogue Input, High Speed Analogue Input, Digital Input/Output, Digital Relay Output, Analogue Output and Pt-100 temperature Sensor Input.

For a compact and efficient system, Trainnet® Event Recorder can be used as part of a broader Trainnet® system, for instance integrated to a Gateway, a VCU or a TCMS.

**DATA RETRIEVAL AND ANALYSIS**

Data can be retrieved at any time via the Event Recorder Ethernet port using the Trainnet® TIP Software (Train Inspection Program). The TIP Software enables the download and the analysis of the train data. Alternatively, the data can be transferred to a USB stick, for convenient transport or storage. The data is easily imported from the USB stick to the TIP Software.

The Trainnet® Event Recorder proves useful beyond traditional use following an incident. The retrieved data can be visualized with the TIP Software in order to perform regular system performance analysis and train operational optimization.

**RUGGED MEMORY MODULE**

The Trainnet® Rugged Memory Module (RMM) is available as an option whenever a high level of data protection is needed. This crash-proof construction guarantees that the memory board is protected against fire, magnetic fields and any liquids, as well as against any mechanical stress during an impact or continued pressure. In practice, the memory board is embedded in a protected fire insulation block, surrounded by a special steel case that is hermetically sealed.

The design of the Trainnet® Rugged Memory Module fulfils the British (GM/RT2472-1.2002) and European (EEIG 97E461-3.1998) crashworthiness as well as the IEEE (1482.-1.1999) standards. This makes the Trainnet® Event Recorder suitable for trains worldwide.

**JURIDICAL RECORDING UNIT**

The Trainnet® Juridical Recording Unit (JRU) is a train event recorder complying with the ERTMS/ETCS standard. The Trainnet® JRU has all the features of other Trainnet® Event Recorder and is equipped with the Trainnet® Rugged Memory Module for data protection.

The Trainnet® JRU can record data from the ETCS (i.e. European Virtual Computer, EVC) and/or from nation-specific control systems (i.e. Specific Transmission Module, STM). The ETCS architecture illustration highlights the two standard setup options.

**GPS/GNSS**

As an option, a GNSS (Global Navigation Satellite System) receiver can be integrated into the Event Recorder. Versions with GPS+GLONASS and GPS+BeiDou are available. This option requires 4TE of additional space in the rack (one free bus interface slot).

**RACKS AND SIZES**

The modularity of the Trainnet® Event Recorders means you can choose a rack size based on your needs: the more additional interfaces or features you need, the larger is the rack that you need to select. The table on the previous page presents some of the possible alternatives.
Human Machine Interface (HMI)

**FUNCTIONS**
The Trainnet® Human Machine Interfaces (HMI) are interactive displays. They can be used to display information to train drivers or crew members with interactive displays. They can also be used as CCTV monitor as well as for any Trainnet® applications.

**KEY FEATURES**
The Trainnet® HMIs are flexible devices providing ease of use and robustness for all Trainnet® applications.

The touch control buttons positioned around the display area provide great durability with no mechanical part to wear out. The layout of the keys is designed according to the international UIC 557 standard. You can easily configure the keys to match any of your requirements.

The flat displays, including the touch control buttons, are protected behind an anti-reflective vandal proof safety glass (IK 07, IP 65 tightness) for durability.

As the displays are very compact, they can be fitted virtually anywhere in the train and are easy to mount (rear fixing for protection). Two sizes are available for flexibility: 6.5” and 12.1” with respectively 640 x 480 and 1024 x 768 pixel resolutions.

As part of a Trainnet® System, the HMI is usually configured and controlled by the Train Computer’s CPU (Trainnet® CPG, Central Processing unit with Graphics controller). There is a DVI-I interface and a touch screen interface integrated into the same cable.

The Trainnet® HMI also sends self-diagnostics data to the Train Computer, such as module temperature and the count of lamp’s operating hours. The display does not include any moving parts and the lamp is the only replaceable component. The absence of components that are subject to any wear out guarantees a long unit lifetime.

**OPTION**
The Trainnet® HMI 12.1” is available as a full touch screen as an option (12.1” FT). The 12.1” FT display does not have touch control buttons around the display area.

**TECHNICAL SPECIFICATIONS**

- **Dimensions (W x H x D)**
  - 6.5”: 220 x 170 x 125 mm
  - 12.1”: 340 x 270 x 106 mm

  - 12.1” and 12.1” FT: 1024 x 768 (XGA)

- **Active Display Area**
  - 6.5”: 133 x 99 mm
  - 12.1”: 246 x 184 mm
  - 12.1” FT: 245 x 184 mm

- **Colour Depth**
  - 262 144

- **Viewing Angle (Cr≥10)**
  - 6.5”: -50~50(H) -60~30(V)
  - 12.1”: -65~65(H) -75~45(V)

- **Luminance**
  - 6.5”: 440 cd/m² typ.
  - 12.1” and 12.1” FT: 320 cd/m² typ.
ISaGRAF
PLC Software

FUNCTIONS
The ISaGRAF Software is designed for efficient programming of PLC applications of Trainnet® Systems. It is also used for commissioning and debugging. It complies with the IEC 61131 standard.

KEY FEATURES
ISaGRAF is a control software environment that enables you to create distributed control systems. It offers a combination of a highly portable and robust control engine (Virtual Machine) as well as an intuitive application development environment (Workbench).

The ISaGRAF Application development Workbench supports all of the standard IEC 61131 control program languages as well as the Flow Chart.

These Languages are:
- Sequential Function Chart (SFC)
- Function Block Diagram (FBD)
- Ladder Diagram (LD)
- Structured text (ST)
- Instruction List (IL)
- Flow Chart (FC)

You may use any or all of the control languages in your application as it best suits your needs.

The ISaGRAF series of toolkits give you the ability to write your own I/O drivers and supports "C" user programs. Functions and function blocks written in C can be called directly from any of the six supported languages. These routines become an extension of the ISaGRAF languages.

We have already developed number of functions and function blocks that are designed for rail applications. For instance for communication over various train networks such as WTB with UIC 556, MVB and for most typically used Ethernet protocols.

All the Trainnet® CPUs (CPG and CPS) except CPE include ISaGRAF Linux run time to execute the ISaGRAF applications. The Trainnet® target supports multitasking systems.

We can develop custom functions and function blocks that match your needs. We can provide tools and training to help you develop your own train application. We can also help you building more advanced capabilities to integrate your own I/O devices and C Functions.

Train Inspection Program (TIP)

FUNCTIONS
The Trainnet® Train Inspection Program (TIP) is a Software tool used for the transfer and analysis of the data recorded in the Trainnet® Event Recorders. The tool allows for the visualization, analysis and printing of the records, as well as real-time train monitoring.

KEY FEATURES
The Software is compatible with Windows 8, Windows 7, Windows XP and Windows Vista operating systems. The Data can be downloaded with the TIP Software by connecting a PC or a USB memory stick to the Trainnet® Event Recorder.

The TIP has been designed with the ease of use and customization in mind. The Software is able to display the data in several ways such as graphically and numerically or with signal states and comprehensive reports. The Trainnet® TIP can also be configured to show exactly the information needed for a specific task. The user can instantly locate points of interest in a large data log, or archived registrations for later use. The data views can be customized to suit your specific needs, with everything from colors to line types.

TIP enables you to select exactly the information you require for your analysis. You can for example analyze any numbers or combination of signals displayed along with a scale and a time-period of your choosing. The TIP also enables you to locate an incident or a particular piece of information by using the built-in search and statistical functions.

The Event Recorder data can be archived on a computer, where each registered individual data file can be retrieved for later analysis with the Software. The TIP also allows the saving of a selected portion of recorded data to a new file, without modifying the original data in any way.

TIP has a feature that enables you to display several data files simultaneously. This feature allows you to monitor any selection of signals in the car in real-time, without interfering with the Trainnet® Event Recorder’s normal operations. Under all conditions, the TIP Software tool ensures that your data is kept confidently with the highest levels of integrity.

The data can also be exported to a third party application as the data can be converted to an open format (CSV file).

The TIP Tool also provides an on-line monitoring feature that allows you to monitor any selection of signals in the car in real-time, without interfering with the Trainnet® Event Recorder’s normal operations. Under all conditions, the TIP Software tool ensures that your data is kept confidently with the highest levels of integrity.

Trainnet® TIP Software Multiple View
Portable System Tester (PST)

FUNCTIONS
The Trainnet® Portable System Tester (PST) is a Software tool used to perform diagnostics and configurations of Gateways and train computers. A computer equipped with the PST, can be connected to any gateway or train computer using either serial or Ethernet connection, providing a single point of access to all coaches within the train set.

KEY FEATURES
The Trainnet® Portable System Tester (PST) is compatible with Windows 8, Windows 7, Windows XP and Windows Vista Operating Systems.

The Trainnet® PST is a tool for downloading event history data (e.g. faults and alarms) and provides built-in features for examining the data. Additionally, it is a tool for settings the system time and other operational parameters.

The tool features are largely based upon customer requirements and are project-dependent. However, some of the possible functionalities include:

- Set up operational parameters to the Train Computer, such as time, coach number and type or wheel diameter.
- View I/O channels statuses as well as TCMS link status and signals.
- Download system faults and event logs.
- Keep track of the diagnostic data (faults) already retrieved, and when performing successive retrievals, it downloads only the new, un-retrieved, portion of the data.
- Access to system data, including the train bus process and message data, binary tree (Modbus data), etc.
- Allows modifying off-line parameter files to edit start-up or functional parameters.
- Allows incorporation of any HTML files into the tool, which typically is used to integrate User and Maintenance documentation.
- Customize functions in order to create special reports for selected events, such as Test and Trend Reports, Maintenance Alerts, etc.
- Integrate the Electronic Serial Number (ESN) Programming Tool.
- The PST tool is protected against unauthorised use with usernames and passwords. Users can be arranged in groups that have different permissions to access the data. Selected functionalities can be granted to staff members according to their role (e.g. administration rights or different level of maintainer roles with read/write rights or read only possibility).

Our Services

EKE provides services to support you from the early stages of your project to its very end.

CONSULTING
We can help you to define specifications and to design your system in the most efficient way. We can also advice you on sourcing and recommend suitable technologies and products for the best results. We can help with all technical aspect of your project.

TRAINING
We provide all the necessary training to help you master our technologies, including both Hardware and Software. We can also share with you our experience and know-how to make sure you use our products and tools as efficiently as possible.

SUPPORT
We support you during the entire lifetime of your project. We can help you to develop your own system or alternatively develop it for you. We can also assist you at the installation, testing and commissioning stages, to the extend your require.

MAINTENANCE AND REPAIRS
We guarantee at least 30-years of support for all our products. It shows the faith we have in their quality. We provide fast product repairs, spare parts, Hardware and Software upgrades, support contracts and on-site technical assistance.
Automation Applications

Trainnet® onboard computers can be used to automate the entire trains. Applications can be developed with the ISaGRAF PLC Software or in C-language. You can freely develop your own applications or let EKE do it for you.

CONTROL AND MONITORING
Trainnet® TCMS and VCU can run applications used for the control and monitoring of train sub-systems. For diagnostics, applications can be designed to issue warnings when preset limits are crossed or in case of technical error. The applications can even be programmed to give instructions or take corrective actions automatically. Such applications reduce response times and increase train availability. Controlled sub-systems and functions may include:

- **HVAC**: (heating, cooling, air flow monitoring, fresh air intake management, condensation and evaporation monitoring etc.)
- **Doors**: (opening, closing, locking, jammed door detection etc.)
- **Lights**: (on/off, dimming, day/night setup implementation etc.)
- **CCTV**: (camera status, automatic display relevant screen to the driver in case of incident etc.)
- **Water tanks**: (levels of fresh water and used water etc.)
- **Batteries**: (charge / discharge monitoring etc.)
- **Brakes and traction**: (status, brake temperature, traction effort etc.)
- **PIS/PA**: (see PIS manager)

AUTOMATIC INAUGURATION
With an automatic train inauguration, consists can be connected, disconnected or switched without jeopardizing the train operations. The train configuration changes are automatically detected and the Train Communication Network (TCN) continue to work flawlessly. WTB and Ethernet Train Backbone technology supports such dynamic configuration. EKE has also developed an application Software enabling automatic train inauguration when using MVB as a train backbone for communication.

Example: VALE train PIS/PA, Brazil

TRAINNET® PIS MANAGER
The Trainnet® PIS Manager is an application that enables you to implement and run a Passenger Information System (PIS) directly from your Trainnet® system, with no need to buy a separate PIS/PA system. The information to be conveyed is completely based on your project requirement and can be transmitted via the screens and loud speakers of your choice.
Mobile Applications

Applications for the exchange of information between the train and mobile devices present onboard. You can develop a HMI on tablets for your crew or a PIS for mobile phones.

FUNCTIONS
The Trainnet® Mobile Applications are services accessible from mobile devices present in the train such as smartphones and tablets. In practice they are extensions to your Trainnet® TCMS or VCU: information is exchanged between the train computer and the mobile devices via a wireless network (e.g. WLAN).

MOBILE PIS
One application is to provide information to passenger mobile phones and tablets, creating a mobile Passenger Information System (PIS).

With the Trainnet® Mobile PIS, passengers access travel information from their mobile devices by simply connecting to the train W-LAN. Passengers can for instance check the train departure time, the train location, train connections, line maps, train speed or even outside temperature. Safety and traffic announcements can also be displayed in real-time. Additional services such as news, weather forecast, the on-board restaurant menu, city guide, games as well as advertisements can be provided to passengers via this mobile platform.

The PIS Manager can be used by the train crew to send pre-registered or live audio and text announcements to passengers, to their mobile devices but also to conventional PIS displays and loud speakers available in the train. Train system status, faults and alarms can also be monitored by the train crew from the mobile HMI, if desired.

MOBILE HMI
The Trainnet® Mobile HMI (Human-Machine Interface) enables train managers and train crew in general to access and take control of the train TCMS from their tablet or smartphone via a protected W-LAN. The train manager can for example switch lights or modify air conditioning from anywhere in the train. The Trainnet® Mobile HMI can include a PIS Manager which enables the train crew to control the Passenger Information System from the mobile HMI.

Such a mobile HMI can partly or completely replace traditional HMIs usually installed in every coach, thus allowing significant cost savings.
Safety Integrity Level (sIL)

SIL is an indicator of the relative risk-reduction provided by a safety function. We help you develop SIL functions to make your trains safer and more reliable.

EKE-Electronics has expertise designing and manufacturing systems with Safety Integrity Level (SIL) functions. We have developed systems up to SIL-2 for various safety functions, including speed measurement, temperature measurement and door operation.

STANDARDS
The SIL notion results directly from the IEC 61508 standard which is not railway specific. For the rail industry, CENELEC has developed the EN 50126, EN 50128 and EN 50129 standards which were derived from the IEC 61508 to meet railway specific requirements. Following the CENELEC standards ensures compliance with the IEC 61508.

WHY IMPLEMENTING SIL
The development of Safety Integrity Levels fulfils the need for more approachable and systematic safety management. The SIL probabilistic approach helps to determine the risks associated with a safety function, system or component and to set an acceptable risk level for it.

Four Safety Integrity Levels are defined, ranging from SIL-1 to SIL-4:

<table>
<thead>
<tr>
<th>SIL</th>
<th>PFH**</th>
<th>RRF**</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIL-1</td>
<td>10^-10^-6</td>
<td>10^-10^-6</td>
</tr>
<tr>
<td>SIL-2</td>
<td>10^-10^-7</td>
<td>10^-10^-7</td>
</tr>
<tr>
<td>SIL-3</td>
<td>10^-10^-8</td>
<td>10^-10^-8</td>
</tr>
<tr>
<td>SIL-4</td>
<td>10^-10^-9</td>
<td>10^-10^-9</td>
</tr>
</tbody>
</table>

*PFH: Probability of failure / hour  **RRF: Risk reduction factor

As described in the table above, SIL-4 provides the highest risk reduction factor and is reserved for highly critical safety functions that may cause important casualties and must be prevented at all costs. For most safety functions in a train, SIL-1 or SIL-2 will provide acceptable risk levels. No matter the level, SIL functions contribute to make your trains safer.

WORKING WITH EKE
We can develop SIL applications for you, or alternatively, provide training and guidance to help you develop your own applications.

APPLICATIONS
Safety Integrity Levels can be assigned to virtually any function presenting a safety risk in your train. For example, we have developed the following SIL applications:

SIL-1 | Speed monitoring and display
Analysis of several speed measurements and display of the value to the train crew.

SIL-1 | Monitoring of axle box bearing temperature
Measurement of the axle bearing grease box temperature. Safe Contact Digital Output.

SIL-2 | Monitoring of axle box bearing temperature
Measurement of the axle bearing grease box temperature. Safe Contact Digital Output. Redundant system.

SIL-2 | Lateral acceleration monitoring
Measurement of acceleration peaks in bogie and rodal. Safe Contact (CS) Digital Output. Redundant system.

SIL-2 | Fire detection System monitoring
Reading fire detection signals and SIL-2 data transfer via MVB. Redundant system.

SIL-2 | Safety communication management
Receive, handle and send safety communication data such as temperature pattern, speed data. Validate train configuration information. Redundant system.

SIL-2 | ASDO (Automatic Selective Door Operation)
Bringing flexibility by enabling customized door opening based on platform and safety requirements.

SIL-2 | Train speed measurement
Measurement of train speed in bogie and rodal. Safe Contact (CS) Digital Output. Redundant system.
Monitoring of axle box bearing temperature

FUNCTIONS
Failed bearings on rolling stocks present important safety risks, potentially leading to catastrophic events such as derailment or fire. A rise in the heat generated by a bearing is found to be a good predictive diagnostic of a bearing about to fail.

Thus, monitoring the hot axle box bearing temperature with Trainnet® improves train safety by detecting wheelset bearings presenting a risk of failure.

HABD VS ONBOARD MONITORING
The European standard EN 15437 defines tow methods for axle box condition monitoring (see also illustrations at the bottom of the page):

→ (A) monitoring of hot axle box bearing temperature by on-board systems
→ (B) bearing temperature measurement by track side trackside Hot Axle Box Detectors (HABD)

On-board monitoring was developed to overcome number of limitations of the HABD trackside systems. Firstly, the temperature monitoring is continuous whereas track equipment only measure at one point in time, when the train passes by. Also, the track equipment is used for all trains with no possibility to develop specific solution depending on the train type, bogie design, bearing property, and so on while the on-board system can be tailored to match the train characteristics.

ON-BOARD MONITORING OF AXLE BOX BEARING TEMPERATURE
The rolling bearing temperature can be monitored directly. However, the most common setup up is to monitor the hot axle box temperature, or more precisely, the grease temperature.

The Trainnet® system monitors the bearing temperature at all times via temperature sensors. Acceptable temperatures and temperature variations are set in the system: any value deviating from the norms will trigger alarms and, potentially, actions to guarantee safety.

SAFETY INTEGRITY LEVEL (SIL)
The Trainnet® system for on-board monitoring of axle box bearing temperature can be certified up to SIL-2.
Lateral Acceleration Monitoring (LAM)

The Trainnet® Lateral Acceleration Monitoring (LAM) system contributes to improve safety and passenger comfort.

FUNCTIONS
The Trainnet® Lateral Acceleration Monitoring (LAM) onboard system measures lateral vibrations. Vibrations can have multiple sources, including engines, suspensions, wheelsets, tracks etc. Sensors can be placed in the bogie or on the car body.

KEY FEATURES
The vibrations measured by the acceleration sensors are converted into lateral accelerations values. The data from sensors can be processed in various ways, for example by following methods defined in the industry standard UIC 518:2009. Criteria for acceptable lateral accelerations are defined by setting up threshold values which can be obtained from standards or by performing online testing.

Several levels of alarms can be set, either to notify maintenance teams about abnormalities or even to automatically stop the train in case of immediate danger. In most cases, abnormalities can be detected before the issue represents a safety risk. The Trainnet® LAM is then used as a predictive maintenance tool, allowing for better maintenance planning. To increase reliability further, the system can be redundant.

IMPROVING SAFETY & COMFORT
Excessive train lateral vibration undermines passenger comfort. Some passenger may even tumble and injure themselves. When sensors are placed on the car body, the Trainnet® Lateral Acceleration Monitoring (LAM) system enables control over train stability, thus improving passenger comfort and safety.

PREVENTING DERAILEMENT
With sensors placed in the bogies, wheelset stability on the tracks can be monitored by the Trainnet® Lateral Acceleration Monitoring (LAM) system. Preventing excessive lateral movements of wheels contributes to prevent damages to the train and possible derailment. The measured lateral acceleration can provide information on wheelset conditions, enabling improved maintenance planning. It may also provide insight to identify track damages when equipped with a GPS or other positioning system.

SAFETY INTEGRITY LEVEL (SIL)
Lateral Acceleration Monitoring is a safety critical function commonly developed as SIL-2, providing probabilistic risk reduction factor from $10^{-6}$ to $10^{-7}$.

SIL stands for Safety Integrity Level and is a concept defined in the IEC 61508 standard. For the rail industry, the CENELEC has developed the EN 50126, EN 50128 and EN 50129 standards.
**Vigilance Control System (vcs)**

**FUNCTIONS**
The Trainnet® Vigilance Control System (VCS) can also be referred to as Dead Man’s Switch or Driver Safety Device (DSD).

The Trainnet® Vigilance Control System (VCS) increases train safety by checking the train driver vigilance at all times. When the driver experiences a loss of consciousness, death or any physical issues preventing him to react, the train is automatically stopped.

**KEY FEATURES**
In practice, the train driver notify his vigilance by pressing onto a pedal or a dedicated momentary push button, thus sending a signal to the Trainnet® Vigilance Control System (VCS). The VCS can also monitor other actions, based on your needs.

In case the VCS stops receiving signals, alarms are activated according to a predefined schedule. The first alarm is a blinking light (T1). Should the driver fail to respond within the allowed time frame, a bell ring will be heard (T2). Finally, if still no action is detected from the driver, the Trainnet® VCS will automatically send command for train emergency braking to ensure passengers’ safety (T3).

Automatic braking is also triggered if the Trainnet® VCS is powered off.

The Trainnet® Vigilance Control System can be easily customized, should you need different alarms or a modified setup. For instance, the times T1, T2 and T3 can be configured based on your requirements. It is also possible to set a minimum speed under which the system is not activate (e.g. 10 km/hour). The system can be used standalone or used as part of a more comprehensive Trainnet® system.

**SIL CERTIFICATION**
The Trainnet® VCS can be certified up to SIL-2.

EKE can provide suitable push-buttons, pedals, buzzers and alarm lights on request.
Applications

The SmartVision™ Remote Condition Monitoring System (RCMS) collects and analyses key data from the train fleets. The train status and diagnostic information can be used to improve maintenance, processes and operations. SmartVision™ is modular and the following applications can be implemented:

**KEY FUNCTIONS**

The SmartVision™ Remote Condition Monitoring System (RCMS) collects and analyses key data from the train fleets. The train status and diagnostic information can be used to improve maintenance, processes and operations. SmartVision™ is modular and the following applications can be implemented:

- **Online Monitoring**
  Monitor statuses of onboard systems and inform the control center in real-time, enabling quicker responses to faults and operational challenges.

- **Condition Monitoring**
  Collect diagnostic information from onboard systems and setup condition-based maintenance schemes for improved cost-efficiency.

- **Predictive Analytics**
  Take condition monitoring one step further by using analytics to predict likely lifetimes of parts, enabling predictive maintenance for maximum cost-effectiveness.

- **Trains on map**
  Localisation application enabling you to visualise your rolling stocks on a map in real time. Important train statuses can be displayed on the map.

- **Driving assistance**
  Provide rolling stock drivers with guidance for optimal driving to optimize energy consumption within time schedule.

Example of SmartVision™ Online Monitoring Dashboard

Example of SmartVision™ Train Level View

SmartVision™ (RCMS)

SmartVision™ is a Multifleet Remote Condition Monitoring System enabling real-time analysis of train data to maximise train availability, improve fleet performance and reduce costs.
**SmartVision™ Benefits**

- **Save Money**
  - Maximize rolling stock availability and reduce fleet maintenance costs.

- **React faster**
  - Real-time monitoring enables faster communications and scheduling.

- **Optimize maintenance**
  - From corrective to condition-based and predictive maintenance.

- **Gain in efficiency**
  - Optimize operations and the use of resources.

- **Improve Satisfaction**
  - Well-maintained trains running on time raise passenger satisfaction.

- **Keep full control**
  - Continuous monitoring and open systems for full control.

**TYPICAL SETUP**
SmartVision™ is a multifleet Remote Condition Monitoring System (RCMS) specifically designed for railway applications. The same SmartVision™ system can monitor varied fleets, with heterogeneous characteristics and from different generations. SmartVision™ RCMS is suitable for long distance trains, commuter trains, metros, trams, locomotives, passenger coaches and virtually any other rolling stock.

**Data Acquisition**
SmartVision™ Data Acquisition is performed by Gateways placed in each train. The Gateway collects data from the train (e.g., brakes, doors, HVAC, sensors etc.) and sends it to the wayside.

**Secure Data Management**
SmartVision™ stores the collected train data on a cloud server or on your own servers. The use of Firewalls, VPN and other technical protections are implemented to ensure cybersecurity and privacy for all exchange of information.

**Scalable Back-end Solutions**
SmartVision™ offers a wide range of applications which are automatically scalable, evolving with your needs. User interfaces can be customized to match your requirements. SmartVision™ open interfaces allow integration with other systems.

**WHY CHOOSE EKE**
EKE-Electronics is a pioneer in onboard data transmissions. We collect train-wide information and diagnostic data for more than 30 years, providing drivers and maintenance teams with valuable reports.

With SmartVision™ we take that know-how one step further, enabling real-time monitoring from remote locations such as depots and control centers.

Automatic Selective Door Operating system (ASDO)

**FUNCTIONS**

ASDO stands for Automatic Selective Door Operation or Operating system. ASDO was primarily developed to improve passenger operation at stations where the platforms are shorter than the trains. The Trainnet® ASDO technology gives you the ability to open different train doors at each station to maximize safety and customer comfort.

**OPEN MORE DOORS**

Without ASDO, trainsets with one or several doors not facing the platform would commonly remain shut (B in illustration), forcing passengers to board or leave the trains through other trainsets. In the illustration below, one can see that ASDO enables two more doors to open (C), facilitating passenger movements between the platform and the train. ASDO improves passenger comfort and safety while allowing for shorter stops at stations.

**SAFE OPENING SENSORS**

The ASDO system first checks the platform configuration to ensure doors will only be opened at the right places. Sensors are usually positioned on the tracks as well as in the train to enable detection of safe door openings. Other systems rely on GPS positioning of the train, thus identifying the station, to determine how many doors shall be opened and on what side(s) of the train.

**SAFETY INTEGRITY LEVEL (SIL)**

The Trainnet® ASDO can be certified up to SIL-2.
Central Processing Unit with Graphical Display Controller (CPG)

**MODULE FUNCTIONS**

Trainnet® CPG can be used as a processor to manage train computers and sub-systems connected to them. It integrates a graphical display controller that supports both analogue and digital displays. It can also be used to manage the display of video surveillance recordings. The Trainnet® CPG module is also capable of storing digital media content such as audio announcements in a compressed format for on-board use.

The Trainnet® CPG can be used to develop, store and run applications for the control and diagnostics of on-board systems, making it suitable to develop Train Control and Management Systems (TCMS) or VCU. It can also implement Gateway functionalities by providing the necessary interfaces and routing capabilities.

**KEY FEATURES**

The Digital Signal Processor of the Trainnet® CPG is dedicated for video and audio processing. The Digital Visual Interface (DVI-I) combines both analogue and digital signals and can be directly connected to DVI displays with resolutions up to 1024 x 768 pixels. Touch screens can be connected either through an isolated RS 485 interface or a DVI-cable when using Trainnet® Human Machine Interface (HMI). The audio interface line output can be used to drive audio announcement systems. The interface is isolated on the digital side in order to provide the best audio quality.

Three programmable isolated asynchronous or bit-synchronous SCC channels are available (RS 485) for the connection to compatible devices in the train.

Two 10/100 Mbit/s Full Duplex Ethernet interfaces can be used to connect to any Ethernet Communication Network, typically connecting the CPG with switches or other electronic racks. The Ethernet interfaces can also be directly connected to any Ethernet enabled devices (e.g. network cameras). A bridge between two channels is also supported. The number of Ethernet interfaces can be increased with one of the Trainnet® Ethernet Switches.

The PST interface (usually serial link or Ethernet) enables the use of the Trainnet® Portable System tester (PST) as well as other tools for event log operations, maintenance, debugging, downloading and application development purposes.

The Trainnet® CPG real-time clock is powered by a back-up capacitor and will run for a minimum of 30 days from the time power is no longer applied.

**TECHNICAL SPECIFICATIONS**

- **Dimensions (W x H x D)**: 8 TE x 3 U x 160 mm
- **Weight**: 300 g
- **Input Power**: 5 V DC ± 5 % (1.5 A max., 1 A typ.)
- **Temperature Range (operational)**: -40 °C…+70 °C
- **MTBF (40 ºC ambient temperature)**: 770 000 h (CPG1824A)
- **Video Interface**: DVI-I; Single TMDS digital output and analogue RGB
  Resolution up to 1024 x 768
- **Audio Interface**: Isolated stereo audio line output
  0 – 700 mVRMS to 10 kΩ load
- **Touch Screen Interface**: Integrated RS 485 on DVI interface
- **Serial Interfaces**: 2 isolated RS 485 on front
  (3 if not using the Touch Screen Interface)
  1 RS 232 on front (for maintenance, configuration or ESN dongle)
  1 RS 485 on back for I/Obus connectivity

  A24/D16 Master or Slave
Central Processing Unit with Serial Links (cps, cpf)

MODULE FUNCTIONS
The Trainnet® CPS can be used as a processor to manage train computers and sub-systems connected to them.

The Trainnet® CPS can be used to develop, store and run applications for the control and diagnostics of on-board systems, making it suitable to develop Train Control and Management Systems (TCMS) or Vehicle Control Units (VCU). It can also implement Gateway functionalities by providing the necessary interfaces and routing capabilities.

KEY FEATURES
The Trainnet® CPS Module is a processing unit providing serial communication interfaces. Three (four as an option) programmable isolated asynchronous or bit-synchronous SCC channels are available (RS 485) for connection to compatible devices in the train.

A 10/100 Mbit/s Full Duplex Ethernet interfaces can be used to connect to any Ethernet Communication Network, typically connecting the CPS with switches or other electronic racks. The Ethernet interface can alternatively be directly connected to any Ethernet enabled devices (e.g. network cameras). The number of Ethernet interfaces can be increased with one of the Trainnet® Ethernet Switches.

A USB Host Interface is provided to connect memory sticks or other devices for maintenance purposes. B-type connector is used to protect unattended usage (special tools required).

The ISaGRAF® PLC kernel embedded in the CPU acts as the CPU’s operating Software. Train management applications can be developed with the ISaGRAF® PLC Software in order to create the desired control and diagnostic functions of the train. The open platform runs on the Linux Operating Software and supports further Software development in C language, either as an ISaGRAF® extension or on top of the module’s Linux kernel. The PowerPC processor provides enough processing power for demanding applications with 400 MHz core speed and 64 megabytes of 64-bit wide 100 MHz SDRAM.

A PST interface (usually serial link or Ethernet) enables the use of the Trainnet® Portable System tester (PST) as well as other tools for event log operations, maintenance, debugging, downloading and application development purposes.

The Trainnet® CPS real-time clock is powered by a back-up capacitor and will run for a minimum of 30 days from the time power is no longer applied.

OPTIONS
Event logging memory: the Trainnet® CPF is simply a Trainnet® CPS with an extended event logging flash memory (4 GB vs 512 MB). Trainnet® CPF can act as a low cost event recorder when limited memory and protection are required. The Trainnet® CPF has all the features of the Trainnet® CPS.

Central Processing Unit with Ethernet Bus (cpe)

MODULE FUNCTIONS
The Trainnet® CPE is a straightforward processing unit designed exclusively for Ethernet bus connectivity. It is used exclusively as a part of the Trainnet® Remote Input/Output Module (RIOM) to redirect I/O signals between the train computer (e.g. VCU) and the RIOM.

KEY FEATURES
The Trainnet® CPE comes with a 10/100 Mbit/s Full Duplex Ethernet interface that is used to connect to the Trainnet® train computer.

The Trainnet® CPE simply reads and writes I/O signals. It is able to redirect input signals from the RIOM to the train computer. The CPE can also get information from the train computer and pass it on to the RIOM I/O modules that generate output signals.

Please note that the CPE does not have a real-time clock or flash memory: it cannot be used to run train applications. It works only when it is connected to a Trainnet® train computer, typically a Gateway, VCU or TCMS.

**Onboard Mobile Gateway (omg)**

**MODULE FUNCTIONS**
The Trainnet® OMG is an Onboard Mobile Gateway (OMG). It integrates multiple wireless communication capabilities such as 3G, LTE/4G, Wi-Fi and GNSS (GPS etc.) for IoT and train-to-wayside communications as well as for the reception of location and time information.

In addition, the Trainnet® OMG can be used to manage Trainnet® input/output modules as part of a Remote Input/Output Module (RIOM).

**KEY FEATURES**
The Trainnet® OMG is equipped with a 1 Gbit/s Ethernet interface for high speed communication with the train network and other compatible devices. A Micro-USB port is also available on the front panel for Firmware loading and maintenance operations.

The OMG module features three separate radios: LTE-A, WiFi and GNSS. All modules work independently.

The LTE-A Category 6 (3GPP Rel 12 LTE technology) component delivers max 300 Mbps downlink and max 50 Mbps uplink.

It also supports LTE/WCDMA Rx-diversity and 3G HSPA+ with max 42 Mbps downlink and 5.76 Mbps uplink. Our standard module works in EMEA, Australia and Brazil. The 3G/4G function requires a micro-SIM card to operate.

The GNSS supports simultaneously GPS and Glonass open service L1 (1575.42 MHz) reception with 33 tracking channels, 99 acquisition channels and 210 PRN channels. This module support short circuit protection and it is suitable for use with both active and passive antennas. It also supports anti-jamming, multi-tone active interface canceller function.

The Trainnet® OMG open platform runs on the Linux Operating System and supports Software development in C language. The OMG features a 800 MHz 64-bit ARM Cortex-A53 processor core.

**Processor RAM**: 512 MB DDR3L
MODULE FUNCTIONS
Trainnet® Wire Train Bus (WTB) modules are used to create train-wide communication networks. The WTB module implements the WTB link layer functions of the IEC 61375-2-1 Train Communications Network standard. The TCN’s real-time protocols, the UIC leaflet 556 specifications and the routing between the WTB and other buses are implemented by the gateway CPU Module.

KEY FEATURES
The WTB MAU supports physical cable redundancy as specified in the IEC 61375-2-1 standard. It uses TCN standard’s Sub D-9 type connectors located on the front panel of the module. Communication to the gateway is done through a shared memory over the IEC 821 VME back plane bus. The WTB link layer functions are implemented by the WTB module’s local processor.

The Trainnet® WTB module has a static shared RAM memory accessible from both the local CPU and the VME Bus interface. The TCN standard’s source and sink port handling for WTB process data is supported. A separate memory area is reserved for message data and maintenance messages as well as for Remote Procedure Call type access to the Link Layer primitives. The WTB module is able to provide applications with timing synchronization when a Macro Period finishes.

The WTB module is realised through the highly efficient combination of a dedicated microprocessor and FPGA logic. In addition to strict compliance with the IEC 61375-1 standard, the WTB module has the capability of carrying out enhanced diagnostics functions, like monitoring the bit error ratios between individual train coaches in order to identify communication issues.

In order to handle incompatible cabling or extremely harsh operating conditions, the WTB module is able to act as a bus repeater by completely regenerating the data streams towards both extremities. Intelligent repeater management is included in the WTB module’s system Software. It supports the selection of an optimal number of concurrently enabled repeaters on the train bus, thus allowing the network timing to retain undegraded specifications.

OPTIONS
Fitting voltage: The WTB bus interface sustains fitting voltage. Fitting voltage source is available as an option: see Trainnet® WTB 2259B and WTB 2376B modules.

Redundant connectors: In the basic module, the bus redundancy is integrated into a single bus connector. Separated connectors for the redundant bus are available as an option: see Trainnet® WTB 1912B and WTB 2376B modules.

Multifunction Vehicle Bus Interface Module (mVB)

MODULE FUNCTIONS
Trainnet® Multifunction Vehicle Bus (MVB) modules are used to create vehicle buses or more comprehensive train communication networks. The Multifunction Vehicle Bus Module implements the MVB link layer functions of the IEC 61375-3-1 Train Communications Network standard. The TCN’s real-time protocols and the routing between the MVB and other buses are implemented by the gateway CPU Module.

KEY FEATURES
The Trainnet® Multifunction Vehicle Bus module supports physical cable redundancy and full bus master functionality as specified in the IEC 61375-3-1 standard. Bus administrator redundancy is supported on the Software level.

TCN standard’s D-9 type connectors are located on the front panel of the module. Communication to the gateway is conducted through shared memory over the IEC 821 VME back plane bus. The MVB link layer functions are implemented by the MVB module’s local processor. Multiple Trainnet® MVB modules can be controlled by a single Trainnet® CPU to implement physically separated MVB networks.

The Trainnet® MVB module has static shared RAM memory accessible from both the local CPU and the VME Bus interface. A separate memory area is reserved for message data and maintenance messages as well as for Remote Procedure Call type access to the Link Layer primitives.

The MVB module is realised through a highly efficient combination of local microprocessor and FPGA logic. In addition to strict compliance with the IEC 61375-3-1 standard, the MVB module has the capability of carrying out some diagnostic functions.

OPTIONS
Physical interface. The following MVB module physical interfaces are available: Electrical Short Distance with isolation (ESD+) and Electrical Medium Distance (EMD). ESD+ and EMD come with two sub D-9 connectors.

TECHNICAL SPECIFICATIONS
Dimensions (W x H x D)
4 TE x 3 U x 160 mm
Weight
ESD: 160 g / EMD: 220 g
Input Power
5 V DC ± 5 % (1 A max., 0.5 A typ.)

A24 Slave with D08(EO)/D16
246 kB SRAM and 512 kB traffic memory for process and message data
### CAN Vehicle Bus Interface Module (cvB)

#### Module Functions
The Trainnet® CAN Vehicle Bus Interface module (CVB) is used to create up to two CAN Buses in the train. The 2 CAN ports can be independently configured as CAN 2.0 A/B or CANopen®. The Trainnet® CVB module implements the CAN link layer functions. The routing between the CAN bus and other buses are implemented by the gateway CPU Module.

#### Key Features
The module has two CAN network connectors on the front-panel, one 9-pin sub-miniature D-type connector for each independent interface. Communication to the gateway is done through shared memory over the IEC 821 VME back plane bus. The CAN link layer functions and CAN network access are implemented with the local CPU of the CAN module. Multiple Trainnet® CVB modules can be controlled by a single Trainnet® CPU to implement physically separated CAN networks.

The Trainnet® CVB module has static shared RAM memory accessible from both the local CPU and the VME Bus interface. The CVB module is realized through a highly efficient combination of local microprocessor and FPGA logic. The Trainnet® CAN Vehicle Bus Interface Module has the capability of carrying out some specific diagnostics functions. Interfaces are Dual CAN 2.0 B and ISO 11898 compatible with a CiA DS-102 standard pin.

#### Options
**Bus interfaces:** The Trainnet® CVB module is available as an option with integrated bus termination resistors.

---

#### Technical Specifications

**Dimensions (W x H x D)**
4 TE x 3 U x 160 mm

**Weight**
149 g

**Input Power**
5 V DC ± 5 % (500 mA nominal)

**Temperature Range (operational)**
-40 °C…+70 °C

**MTBF (40 ºC ambient temperature)**
1,880,000 h (CVB1621B CAN terminated)
1,880,000 h (CVB2456B CAN not terminated)

**CAN Network Interface**
Two CAN interfaces

**Data Rate**
Up to 1 Mbit/s

**Protocol**
CAN 2.0 compatible

**Electrical**
24 V compliant, optically isolated

**Connector**
9-pin sub-miniature D-type connector
AWG 20 STP cable recommended

**Bus Termination**
On board 120 Ohm termination on request

**VME Bus (IEC 821) Interface**
A24 Slave with D08(E0)/D16

---

**Technical Standards**
- EN 50155
- EN 45545
- IEC 61375-3-3
Serial Links Interface Unit (SIU)

**MODULE FUNCTIONS**
The Trainnet® Serial Links Interface Unit (SIU) is used to implements up to eight serial links. The physical layer level and parts of data link layer are implemented within SIU and higher protocol layers are implemented on the system CPU.

For gateway applications, the routing between the Serial Link buses and other buses are implemented by the train computer CPU module.

**KEY FEATURES**
The module has one DIN41612-F48 connector on the front-panel where Serial Links can be connected. Serial links are split in two identical groups which are isolated from the FPGA and from each other. In each group there are four Serial Links that can be configured in different ways according to the table below.

Communication between the module and the train computer/system is done through shared memory over the IEC 821 VME back plane bus.

The Trainnet® SIU module provides 2 kByte long RX and TX double buffers for each serial link. The system CPU can access these buffers through the VME shared memory. A dedicated FPGA controls precise timing for all eight channels in parallel and provides convenient double buffering for the system CPU. This guarantee high performance in demanding safety critical applications.

**OPTIONS**
The Trainnet® SIU comes in 2 different versions offering different Serial Interface combinations. Please consult the table below for specifications. Other configurations are available upon request.

**TECHNICAL SPECIFICATIONS**
- Dimensions (W x H x D): 4 TE x 3 U x 160 mm
- Weight: 140 g
- Input Power: 5 V DC ± 5 % (250 mA typ., 400 mA max.)
- Temperature Range (operational): -40 °C...+70 °C
- MTBF (40 ºC ambient temperature): 2 600 000 h
- Connector: DIN41612-F48 (at front)
- Serial Link Interfaces: 2 isolated groups
- See table for all options
- FPGA Shared Memory: TX buffers: 8 x 2 x 2 kB, RX buffers: 8 x 2 x 2 kB
- VME Bus (IEC 821) Interface: A24 Slave with D08(EO)/D16

**Ethernet Router Unit (ERU)**

**MODULE FUNCTIONS**

The Trainnet® Ethernet Router Unit (ERU) is a combination of high performance Ethernet router and switch. It is used as an Ethernet Train Backbone node (ETBN) to create integrated Ethernet Train Backbone (ETB) and Ethernet Consist Networks (ECN). It provides connectivity for devices with an Ethernet connection and can complement or replace the Wire Train Bus (WTB).

The Trainnet® ERU module implements the ETB link layer function of the IEC 61375-2-5 as well as the ECN link layer function of the IEC 61375-3-4 Train Communication Network Standards. The Ethernet technology's large bandwidth (typically 100 Mb/s) is particularly suitable for data intensive systems like video surveillance or Passenger Information Systems.

**KEY FEATURES**

The Trainnet® ERU module routes traffic between the ETB and the ECN. 4 ports are dedicated to the ETB (2 separate lines in each direction of the vehicle) and 6 to the ECN. The bypassing functionality allows the information from the ETB to go through even if the car is unpowered. The Trainnet® ERU's non-blocking (QoS Layer 2) switching architecture provides large bandwidth: its 10 ports are 10/100BASE-TX Mbit/s Full Duplex Ethernet with auto MDI/MDIX M12 connectors. If required, two Ethernet ports can be replaced by 1 Gbit/s optical fiber SFP ports or M12 X-coded 1 Gbit/s ports for increased bandwidth. The Ethernet ports are located on the front panel of the module and communication to the gateway is done via one of the Ethernet ports. An Electronic Serial Number (ESN) port is available for device identification and configuration.

The ERU's ECN ports can be partitioned to create distinct ECN subnets using a virtual router. The device also supports dynamic routing protocols. The possibility of using link aggregation provides an opportunity to increase data transfer capabilities as well to create redundancies.

The ERU module automatically handles the train inauguration as consists are connected to and disconnected from the train set. There is support for dynamically connecting up to 63 train backbone nodes. The module also has a DDNS server (i.e. dynamic DNS server), so that end devices in vehicles can connect to each other through their domain names, not only the IP addresses. The ERU provides the train topology information to applications in a train directory.

Port mirroring can be used to copy packet data seen on a switch port to another port for diagnostic and monitoring purposes. ERU supports Virtual Router Redundancy Protocol (VRRP) providing enhanced reliability: if a module stops working, its IP address is automatically transferred to a redundant device, ensuring continuous operations.

The ERU module's ECN switch provides connectivity to the consist network switches in a ring configuration (allows redundancy), or by connecting ports directly to end devices. The switch provides services such as Dynamic Host Configuration Protocol (DHCP) in order to assign IP addresses to end devices automatically. The management processor also provides VLAN configurations and Layer 3 switching. It enables diagnostic functions such as the identification of faulty cables.

Compact Ethernet Switching Unit (3U ESU)

**MODULE FUNCTIONS**
The Trainnet® Compact Ethernet Switching Unit (3U ESU) is a versatile Ethernet switch module suitable for building cost effective Ethernet Consist Networks (ECN). It can also be used to create an Ethernet train bus in the case of a fixed train set when there is no need for automatic inauguration.

The Trainnet® 3U ESU non-blocking (QoS Layer 2) switching architecture provides large bandwidth: it has 10 Ethernet ports which are 10/100BASE-TX Mbit/s Full Duplex Ethernet with auto MDI/MDIX M12 connectors. If required, two of the Ethernet ports can be replaced by 1 Gbit/s optical fiber SFP ports or M12 X-coded 1 Gbit/s ports for increased bandwidth. The Ethernet ports are located on the front panel of the module and communication to the gateway is done via one of the Ethernet ports. An Electronic Serial Number (ESN) port is available for device identification and configuration.

The car can be equipped with two redundant Trainnet® 3U ESU modules in order to increase system reliability. If the principal module fails, the secondary module takes over the functionality.

The Trainnet® 3U ESU provides connectivity to the consist network switches in a ring configuration (allows redundancy), or by connecting ports directly to end devices. The switch provides services such as Dynamic Host Configuration Protocol (DHCP) in order to assign IP addresses automatically to end devices. The management processor also provides VLAN configurations and Layer 3 switching. It enables diagnostic functions such as the identification of faulty cables.

The 10 ports of the 3U ESU can be partitioned to create distinct ECN subnets using a virtual router. The device also supports dynamic routing protocols. The possibility of using link aggregation provides an opportunity to increase data transfer capabilities as well to create redundancies.

Port mirroring can be used to copy packet data seen on a switch port to another port for diagnostic and monitoring purposes. 3U ESU supports Virtual Router Redundancy Protocol (VRRP) providing enhanced reliability: if a module stops working, its IP address is automatically transferred to a redundant device, ensuring continuous operations.

**TECHNICAL SPECIFICATIONS**
- Dimensions (W x H x D): 16 TE x 3 U x 160 mm
- Weight: 520 g
- Input Power: 5 V DC ± 5 % (1.5 A typ. 3 A max.)
- Temperature Range (operational): -40 ºC…+70 ºC
- MTBF (40 ºC ambient temperature): 690 000 h
- Ethernet Interfaces: 10 x 10/100 Mbit/s M12 (1 Gbit/s M12 or SFP as an option for ports 1 and 2)
- Serial Interface: 1 RS 232 on front (for maintenance, configuration or ESN dongle)
- Switching Buffer Memory: 2 Mbits
- Management CPU: PowerPC 667 MHz
- Flash Memory: 512 MB
- RAM: 256 MB

**EN 50155**  
**EN 45545**  
**IEC 61375-3-4**
The Trainnet® Ethernet Switching Unit with PoE (3U ESU POE) is an Ethernet switch used to build Ethernet Consist Networks (ECN). It can also be used to create an Ethernet train bus in the case of a fixed trainset with no need for automatic inauguration.

The Trainnet® 3U ESU POE module implements the ECN link layer function of the IEC 61375-3-4 Train Communications Network Standard. The Ethernet technology’s large bandwidth (typically 100 Mb/s) is particularly suitable for data intensive systems like video surveillance or Passenger Information Systems.

**KEY FEATURES**
The Trainnet® 3U ESU POE has 11 Ethernet ports which can have different properties. The 3 categories are:

- **4 x 100 Mbit/s Full Duplex Ethernet port with auto MDI/MDIX M12 connectors**
- **4 x 100 Mbit/s Full Duplex Ethernet port with auto MDI/MDIX M12 connectors**
- **3 x 1 Gbit/s Full Duplex Ethernet port with auto MDI/MDIX M12 connectors**

3U ESU POE supports Virtual Router Redundancy Protocol (VRRP) providing enhanced reliability: if a module stops working, its IP address is automatically transferred to a redundant device, ensuring continuous operations. The car can also be equipped with two redundant Trainnet® 3U ESU POE modules to increase system reliability. If the principal module fails, the secondary module takes over the functionality.

The 3U ESU POE provides connectivity to the consist network switches in a ring configuration (allows redundancy), or by connecting ports directly to end devices. The switch provides services such as Dynamic Host Configuration Protocol (DHCP) in order to assign IP addresses to end devices automatically. The management processor provides also VLAN configurations Layer 3 switching. It enables diagnostic functions such as the identification of faulty cables and PoE monitoring.

It features a non-blocking (QoS Layer 2) switching architecture.

**MODULE FUNCTIONS**
The Trainnet® Ethernet Switching Unit with PoE (3U ESU POE) is an Ethernet switch used to build Ethernet Consist Networks (ECN). It can also be used to create an Ethernet train bus in the case of a fixed trainset with no need for automatic inauguration.

The Ethernet ports are located on module’s front panel and communication with the other modules is done via the VME bus. Ethernet ports can be partitioned to create distinct ECN subnets using a virtual router. The device also supports dynamic routing protocols and link aggregation (to increase data transfer capabilities but especially to create redundancy). Port mirroring can be used to copy packet data seen on a switch port to another port for diagnostics and monitoring purposes.

The PoE functionality provides power to cameras, intercoms and other low-power equipment via the Ethernet cable, thus simplifying and reducing train cabling.

The Ethernet interfaces are:
- **4 x 10/100 Mbit/s with PoE, M12**
- **4 x 10/100 Mbit/s, M12**
- **3 x 1 Gbit/s, M12**

**TECHNICAL SPECIFICATIONS**
- Dimensions (W x H x D): 20 TE x 3 U x 160 mm
- Weight: 1 Kg
- Input Power: 5 V DC ± 5 % (4 A max., 1.5 to 2.5 A typ.)
- Nominal PoE voltage: 110V DC
- Temperature Range (operational): -40 ºC…+70 ºC
- MTBF (40 ºC ambient temperature): 880 000 h (ESU3712A)
- Ethernet Interfaces:
  - 4 x 10/100 Mbit/s with PoE, M12
  - 4 x 10/100 Mbit/s, M12
  - 3 x 1 Gbit/s, M12
- Switching Buffer Memory: 2 x 2 Mbits
- PoE Classification: IEEE802.3af/at with two-event classification
- Total power for PoE: 75 W
- Management CPU: Cortex M4 MCU 168 MHz, 512kB Flash

EN 50155
EN 45545
IEC 61375-3-4
**Unmanaged Ethernet Switching Unit (UM-ESU)**

**MODULE FUNCTIONS**
The Trainnet® Unmanaged Ethernet Switching Unit (UM-ESU) is a straightforward Ethernet switch module. It can be used to connect Ethernet devices. When associated with a managed switch (e.g. Trainnet® 1U ESU, 3U ESU, 3U ESU PoE or ERU), it can also be used to create cost effective Ethernet Consist Networks (ECN).

**KEY FEATURES**
The Trainnet® UM-ESU non-blocking switching architecture provides large bandwidth: it has 8 Ethernet ports which are 10/100BASE-TX Mbit/s Full Duplex Ethernet with auto MDI/MDIX M12 connectors. The Ethernet ports are located on the front panel of the module and communication to the gateway is done via one of the Ethernet ports.

**TECHNICAL SPECIFICATIONS**
- **Dimensions (W x H x D)**: 12 TE x 3 U x 160 mm
- **Weight**: 250 g
- **Input Power**: 5 V DC ± 5 % (0.4 A typ. 0.7 A max.)
- **Temperature Range (operational)**: -40 °C...+70 °C
- **MTBF (40 °C ambient temperature)**: 4,000,000 h
- **Ethernet Interfaces**: 8 x 10/100 Mbit/s M12
- **Switching Buffer Memory**: 2 Mbits
**Ethernet Switching Unit (1U ESU)**

**MODULE FUNCTIONS**
The Trainnet® Ethernet Switching Unit (1U ESU) is an Ethernet switch used to build Ethernet Consist Networks (ECN). It can also be used to create an Ethernet train bus in the case of a fixed trainset with no need for automatic inauguration.

The Trainnet® 1U ESU module implements the ECN link layer function of the IEC 61375-3-4 Train Communications Network Standard. The Ethernet technology's large bandwidth (typically 100 Mb/s) is particularly suitable for data intensive systems like video surveillance or Passenger Information Systems.

**KEY FEATURES**
The Trainnet® 1U ESU has 15 Ethernet ports which can have different properties. Three port technologies are available:

- 10/100 Mbit/s Full Duplex Ethernet port with auto MDI/MDIX M12 connectors
- 10/100 Mbit/s Full Duplex Ethernet port with auto MDI/MDIX M12 connectors and Power-over-Ethernet (PoE)
- 1 Gbit/s optical fiber SFP port for larger bandwidth (single fibre, multimode fibre or copper cables)

The PoE functionality provides power to cameras, intercoms and other low-power equipment via the Ethernet cable, thus simplifying and reducing train cabling. The PoE power supply module (PSE) is used to provide 48 V DC from different train battery voltages to 1U ESU modules. Up to three power supplies (PSE) can be used together with two ESU modules in one 3U 19” rack to provide a standalone switch with a total of up to 30 ports including 24 ports with PoE.

The ESU is a 1U rack unit and includes a management CPU and Switch using the Virtual Router Redundancy Protocol (VRRP) to provide enhanced reliability: if a module stops working, its IP address is automatically transferred to a redundant device, ensuring continuous operations. The car can also be equipped with two redundant Trainnet® 1U ESU modules to increase system reliability. If the principal module fails, the secondary module takes over the functionality.

The 1U ESU provides connectivity to the consist network switches in a ring configuration (allows redundancy), or by connecting ports directly to end devices. The switch provides services such as Dynamic Host Configuration Protocol (DHCP) in order to assign IP addresses to end devices automatically. The management processor provides also VLAN configurations Layer 3 switching. It enables diagnostic functions such as the identification of faulty cables and PoE monitoring. It features a non-blocking (QoS Layer 2) switching architecture.

**OPTIONS**
Port combinations (2 options available to meet different technical requirements):

- 12 x 10/100 with PoE + 1 x 10/100 + 2 x SFP (ESU1906A)
- 15 x SFP (ESU2250A)

**TECHNICAL SPECIFICATIONS**
- Dimensions (W x H x D): 84 TE x 1 U x 160 mm
- Weight: 550 g
- Input Power: 5 V DC ± 5 % (4 A max., 1.5 to 2.5 A typ.)
- Temperature Range (operational): -40 °C...+70 °C
- MTBF (40 ºC ambient temperature): 550 000 h (ESU1906A)
  640 000 h (ESU2250A)
- Ethernet Interfaces:
  - ESU1906A:
    - 12 x 10/100 Mbit/s with PoE, M12
    - 1 x 10/100 Mbit/s, M12
    - 2 x 1 Gbit/s available in SFP module slot
  - ESU2250A:
    - 15 x 1 Gbit/s available in SFP module slot
- Switching Buffer Memory: 2 Mbits
- Management CPU: Blackfin DSP, 500 MHz, 100 Mbit/s Ethernet
- Flash Memory: 8 MB
- RAM: 16 MB

**EN 50155**
**EN 45545**
**IEC 61375-3-4**
Analogue Input Module (AIM)

**MODULE FUNCTIONS**
The Trainnet® Analogue Input Module (AIM) provides a standard interface for analogue input signals. Signals can be current (-20...+20mA) and voltage (-10...+10V). Separate channels are provided for frequency signal measurements with the capability to measure pulse-width ratio (PWM). The Trainnet® AIM converts the analogue signals and makes them available to the train computer’s CPU Module.

The Trainnet® Analogue Input Module can be used as a part of a Trainnet® TCMS, VCU or Event Recorder. Alternatively, the Trainnet® AIM can be fitted into the Trainnet® Remote I/O Module (RIOM).

**KEY FEATURES**
The Trainnet® AIM has 10 current channels and 10 voltage channels divided in three isolated groups. 4 frequency channels are also available.

The 10 current measurement channels can measure currents between -20 and +20 mA. The module has the capability to supply voltage to external sensors or to supply loop voltage to the current loops. The module’s 10 voltage measurement channels can measure voltages between -10 and +10 V. The resolution of the input A/D conversion is sign+12 bits, and the cut-off frequency of the hardware low pass filter is 10 Hz. Both current and voltage channels are capable of giving over range indications which can be used for diagnostic purposes.

The 4 frequency input channels can measure frequencies up to 16 kHz, period, pulse width, pulse count and rotary decoding with direction indication (compatible with most industry standard tachometers).

The module has its own 32-bit embedded processor that uses factory calibration values to convert the measurement value to mV or μA with great accuracy. The embedded processor also implements diagnostics functions and reports to the system CPU module if it suspects that the input values cannot be trusted.

**SIL-2 CERTIFIED**
The module development is based on the railway standards EN 50126, EN 50128 and EN 50129 in accordance with safety integrity level SIL 2. A non-SIL certified version of the module is also available.

**TECHNICAL SPECIFICATIONS**
- **Dimensions (W x H x D)**: 4 TE x 3 U x 160 mm
- **Weight**: 160 g
- **Input Power**: 5 V DC ± 5 % (650 mA typ. 3 A max.)
- **Temperature Range (operational)**: -40 °C...+70 °C
- **MTBF (40 °C ambient temperature)**: 500 000 h (AIM2505A)
- **I/O Connector**: DIN41612-F48 (at front)
- **Host Interface**: RS 485 serial
- **Input Channels, Analogue**:
  - 10 voltage channels, -10...+10 V (Vin)
  - 10 current channels, -20...+20 mA (Iin)
- **Frequency Input Voltage Range**: DC to 16 kHz, 0.25 Hz resolution
- **Frequency Input Pulse Width Measurement**: 0.1% resolution
- **Tachometer Supply Outputs (Vout)**: 15 VDC, max. 100 mA
High Speed Analogue Input Module (HSA)

MODULE FUNCTIONS
The Trainnet® High Speed Analogue Input Module (HSA) provides a standard interface for analogue input signals. Signals can be current (-20...+20mA) and voltage (-10...10V). Separate channels are provided for frequency signal measurements with the capability to measure pulse-width ratio (PWM). The Trainnet® HSA converts the analogue signals and makes them available to the train computer’s CPU Module.

The Trainnet® High Speed Analogue Input Module can be used as a part of a Trainnet® TCMS, VCU or Event Recorder.

KEY FEATURES
The Trainnet® HSA has 4 current channels and 4 voltage channels divided in four isolated groups. 4 frequency channels are also available.

The 4 current measurement channels can measure currents between -20 and +20 mA. The module has the capability to supply voltage to external sensors or to supply loop voltage to the current loops. The module 4 voltage measurement channels can measure voltages between -10 and +10 V. The resolution of the input A/D conversion is sign+12 bits, and the cut-off frequency of the hardware low pass filter is 150 Hz. Both current and voltage channels are capable of giving over range indications which can be used for diagnostic purposes.

The 4 frequency input channels can measure frequencies up to 16 kHz, period, pulse width, pulse count and rotary decoding with direction indication (compatible with most industry standard tachometers).

The module has its own 32-bit Floating point Digital Signal Processor for a high signal processing capability and uses factory calibration values to convert the measurement value to mV or μA with great accuracy. The embedded DSP processor can be used to perform signal processing tasks like filtering. It also implements diagnostics functions and reports to the system CPU module if it suspects that the input values cannot be trusted.

SIL-2 CERTIFIED
The module development is based on the railway standards EN 50126, EN 50128 and EN 50129 that are in accordance with safety integrity level SIL 2. A non-SIL certified version of the module is also available.

TECHNICAL SPECIFICATIONS
- Dimensions (W x H x D): 4 TE x 3 U x 160 mm
- Weight: 170 g
- Input Power: 5 V DC ± 5% (1 A typ. 3 A max)
- Temperature Range (operational): -40 °C...+70 °C
- MTBF (40 ºC ambient temperature): 390 000 h (HSA2620A)
- I/O Connector: DIN41612-F48 (at front)
- Host Interface: VME Bus A24/D08/D16 Slave
- Input Channels, Analogue: 4 voltage channels, -10...10 V (Vin)
- Input Channels, Frequency: 4 current channels, -20...+20 mA (Iin)
- Frequency Input Voltage Range: 0...36 V DC
- Frequency Input Threshold level: Each channel has its own software configurable threshold level, fixed hysteresis
- Frequency Input Range: DC to 16 kHz, 0.25 Hz resolution
- Frequency Input Pulse Width Measurement: 0.1% resolution
- Tachometer Supply Outputs: 15 VDC, max. 70 mA each
**Analogue Output Module (AOM)**

**MODULE FUNCTIONS**
The Trainnet® Analogue Output Module (AOM) provides standard interface for analogue output signals. The Trainnet® AOM receives instructions from the train computer’s CPU Module and sends analogue signals to sub-systems accordingly.

The Trainnet® AOM can be used as a part of a Trainnet® TCMS, VCU or Event Recorder. Alternatively, the Trainnet® AOM can be fitted into the Trainnet® Remote I/O Module (RIOM).

**KEY FEATURES**
The module has 4 individually isolated analogue output groups. All groups are identical and have 4 analogue output channels. Each group has two PWM outputs.

By default, 2 channels are configured as current loop transmitters with integrated loop supply (current mode) and 2 channels as bipolar voltage output and two digital pulse width modulation outputs (voltage mode). The channel configurations can easily be changed from current mode to voltage mode and vice-versa, depending on your needs. The Trainnet® AOM is able to provide current loop supply voltage internally: there is no need for an external power supply. Configurable ranges are from 4 to 20 mA for current and from -10 to +10 V for voltage.

Each output channel has parameters for calibration (factory set), and diagnostics to detect short or open in current loop and short in voltage output. Outputs are factory calibrated. The module has its own 32-bit embedded processor to manage serial communication with the train computer’s CPU module. The embedded processor also implements diagnostic functions and reports to the train computer’s CPU module if it suspects that the output values cannot be trusted.

The module has an RS-485 serial bus interface for connecting to the train computer.

  Output level 15 V
Digital Input/Output Module (DIO)

**MODULE FUNCTIONS**
The Trainnet® Digital Input/Output Module (DIO) provides a standard interface for digital input and output signals. The Trainnet® DIO receives the digital signals via its input channels and makes them available to the train computer's CPU Module. The Trainnet® DIO receives instructions from the train computer's CPU Module and sends digital signals to the sub-systems accordingly via its output channels. Separate channels are provided for frequency measurements (can be used for tachometer inputs).

The Trainnet® Digital Input/Output Module can be used as a part of a Trainnet® TCMS, VCU or Event Recorder. Alternatively, the Trainnet® DIO can be fitted in the Trainnet® Remote I/O Module (RIOM).

**KEY FEATURES**
The Trainnet® DIO has 24 input channels and 8 channels which can be used either as input channels or output channels. 2 frequency input channels are also available. Up to four outputs can be connected in parallel to increase output current.

One special feature of the DIO module is to support the UIC-556 sleep mode. The DIO can remain active with WTB modules, and provide local initiation and battery voltage monitoring.

The module also provides emergency output short circuit protection: if the output current exceeds its maximum value, the short circuit protection shuts down the output. The status of the short circuit protection is available to the train computer's CPU module. If the communication between the train computer's CPU and the module fails, the module’s output channel goes to a state defined in the application software (emergency output), which can be individually set for each single channel.

The module’s own 32-bit embedded processor implements diagnostics functions and reports to the train computer’s CPU module if it suspects that the input values cannot be trusted. Each input channel has a common test circuit, which is used for real-time diagnostics of the channel. This test is carried out during power-on and repeated during normal operation. The input and output states, and their configuration parameters (wetting current, threshold levels) are accessible by the train computer’s CPU module.

Two separate group voltages with common ground allow split behind two circuit breakers, or having a mixed voltage system. Input and Input/Output channels are split evenly between group voltage 1 and 2. Please note that the groups are not isolated from each other.

**SIL-2 CERTIFIED**
The module development is based on the railway standards EN 50126, EN 50128 and EN 50129 that are in accordance with safety integrity level SIL 2. A non-SIL certified version of the module is also available.

**TECHNICAL SPECIFICATIONS**
- **Dimensions (W x H x D)**: 4 TE x 3 U x 160 mm
- **Weight**: 179 g
- **Input Power**: 5 V DC ± 5 % (500 mA max., 200 mA typ.)
- **Temperature Range (operational)**: -40 °C…+70 °C
- **MTBF (40 ºC ambient temperature)**: 1 500 000 h (DIO2378A), 1 170 000 (DIO2908A) (SIL-2)
- **I/O Connector**: DIN41612-F48 (at front)
- **Host Interface**: RS 485
- **Number of Input-only Channels**: 24
- **Number of Input/Output Channels**: 8
- **Number of Frequency Input Channels**: 2
- **Frequency Input Range**: 0...32 kHz, resolution 1 Hz
- **Battery Voltage Monitor**: Yes, one or two (UIC-556)
- **Temperature Measurement**: Yes, local CPU
- **Input type**: Current sink
- **Output Type**: High side (FET) from battery voltage
- **Voltage Drop**: Max. 2 V
- **Input/Output Voltage Range**: 16.8...137.5 V DC (1 sec 14...154 V DC)
- **Threshold levels**: Software selectable (both, positive and negative) (either V or % Vin)
- **Software Selectable Wetting Current**: 0 … 25 mA
- **Output Current**: 1.0 A Continuous
Digital Relay Output Module (DRO)

**MODULE FUNCTIONS**
The Trainnet® Digital Relay Output Module (DRO) provides standard relay contacts. The Trainnet® DRO receives instructions from the train computer’s CPU Module and controls output relays accordingly.

The Trainnet® DRO can be used as a part of a Trainnet® TCMS, VCU or Event Recorder. Alternatively, the Trainnet® DRO can be fitted in the Trainnet® Remote I/O Module (RIOM).

**OPTIONS**
The Trainnet® DRO has 8 relay output channels located on the module’s front side. A SIL-2 certified version of the module is also available, but please note that it only has 4 relay output channels. Relays are of type SPDT (Single Pole Double Throw). Relay contacts are available from the DIN41612F connector at the front of the module.

The module is able to take pre-set output states in case of emergency. If the communication between the train computer’s CPU module and the DRO fails, the relays go to emergency states that you can define in the application Software. When the Trainnet® DRO is unpowered, all relays are in Normally Closed state. Emergency states should be defined to match the wiring to Normally Open (NO)/Normally Closed (NC) contacts.

**TECHNICAL SPECIFICATIONS**
- **Dimensions (W x H x D)**: 4 TE x 3 U x 160 mm
- **Weight**: 190 g
- **Input Power**: 5 V DC ± 5 % (500 mA max., 200 mA typ.)
- **Temperature Range (operational)**: -40 ºC…+70 ºC
- **MTBF (40 ºC ambient temperature)**: 830 000 h (DRO2342A)
- **Relay electrical life**: 500 000 cycles
- **I/O Connector**: DIN41612-F48 (at front)
- **Host Interface**: RS 485
- **Number of Channels**: 8
- **Relay Type**: Change over [SPOT] AgNi 0.15 Contacts
- **Maximum Switching Current vs Voltage**:
  - 24 V DC: 3.5 A
  - 48 V DC: 1.4 A
  - 110 V DC: 0.5 A
- **Temperature Measurement**: Yes, local CPU

EN 50155
EN 45545
**Pt100 Temperature Sensor Input Module (PTI)**

**MODULE FUNCTIONS**
The Trainnet® PTI module is a PT-100 temperature sensor input module. It acquires the signals from the PT-100 temperature sensors (resistance measurement) and converts them into temperature values expressed in degrees Celsius. The PTI module makes the measured temperature values available to the train computer’s CPU.

The Trainnet® PTI can be used as a part of a Trainnet® TCMS, VCU or Event Recorder. Alternatively, the Trainnet® PTI can be fitted in the Trainnet® Remote I/O Module (RIOM).

**KEY FEATURES**
The Trainnet® PTI has six PT-100 measurement channels which can measure temperature within the -110 to +325 °C range with over range indication. Each channel is isolated from each other, thus a fault in one channel will not affect the others. PT-100 temperature sensors can be connected using 2-wire, 3-wire or 4-wire schemes providing flexibility.

The measurement resolution is 0.01 °C, with accuracy better than ±1 °C within the measurement range.

The module has its own 32-bit embedded processor that uses factory calibration values to convert measurement values to degrees Celsius with the best possible accuracy. The embedded processor also implements diagnostic functions and reports to the train computer’s CPU module if it suspects that the input values cannot be trusted. The Trainnet® PTI detects the temperature sensor as well as cable faults and input channel faults.

**TECHNICAL SPECIFICATIONS**

- **Dimensions (W x H x D)**
  4 TE x 3 U x 160 mm

- **Weight**
  160 g

- **Input Power**
  5 V DC ± 5 % (310 mA typ., 400 mA max.)

- **Temperature Range (operational)**
  -40 °C…+70 °C

- **MTBF (40 ºC ambient temperature)**
  1 580 000 h (PTI2037A)

- **I/O Connector**
  DIN41612-F48 (at front)

- **Host Interface**
  RS 485

- **Input Channels**
  6 Pt100 sensor

- **Connection Type**
  2-wire, 3-wire or 4-wire

- **Measurement Range**
  -110 °C to + 325 °C

- **Resolution**
  0.01 °C

- **Accuracy**
  Better than ± 1 °C [3- or 4-wire]
Power Supply Unit for VME (PSV)

MODULE FUNCTIONS
The Trainnet® Power Supply Unit for VME (PSV) is a highly reliable switching mode power supply module. It works only together with the Trainnet® PIU module which takes power from the train batteries and transfers it to the Trainnet® PSV module. The Trainnet® PSV module is specially designed for VMEbus systems.

KEY FEATURES
The Trainnet® PSV has built-in circuitry to detect and control the input current in the event of a power-up. Controlling the in-rush current prevents component damages.

The Trainnet® PSV grace supply function enables the module to continue working for a short period of time when the power is cut off. The PSV module withstands 10 ms input power breaks without disrupting any of the normal operations. If the break lasts longer, the power supply is capable of supplying a +5 V DC output during a minimum of 100 ms after the input power is lost, 80 ms for PSV1133B.

* Total output loading must not exceed Output power.

The ACFAIL and SYSRESET signals are activated to ensure proper shutdown of the systems. This feature allows the system to record sub-system and module states during the shutdown, thus enabling event diagnostics. When the input supply voltage is below the set minimum value, Trainnet® PSV minimizes current consumption in order to prevent the deep discharge of train batteries. For various versions and specifications, please revert to the table above.
Power Input Unit (PIU, VIU)

**MODULE FUNCTIONS**
The Trainnet® Power Input Unit (PIU) is used to pass train battery voltage to the Trainnet® PSV module, thus powering the entire Trainnet® systems.

**KEY FEATURES**
The Trainnet® PIU input voltages can be 24 V DC (PIU2056A), 36 to 52 V DC (PIU2510A), 72 V DC (PIU2280A) or 110 V DC (PIU2219A). A Trainnet® PSV with a similar input voltage must be selected.

**OPTIONS**
- **Isolated DC Converter Output:**
  An isolated DC/DC converter may be installed as an option to provide power to any external equipment. If required, the output voltage may be switched off during the system reset in order to force hard-resets of external equipment. Currently available PIU modules with DC Converter Output are listed in the table below. We can also provide you with another versions upon request.

**Vehicle Identification Unit (VIU):**
The Trainnet® VIU has the functionalities of the Trainnet® PIU, and in addition, provides an interface for Electronic Serial Number (ESN). An Electronic Serial Number (ESN) dongle can be connected to VIU for device identification and configuration.

Compact Power Supply Unit (PSR)

**MODULE FUNCTIONS**
The Trainnet® Compact Power Supply Unit (PSR) is a highly reliable switching mode power supply module. It takes power directly from the train batteries. The Trainnet® PSR module is primarily designed to power the Trainnet® RIOM but can also be used for some simple VMEbus systems.

**KEY FEATURES**
The Trainnet® PSR can be operated with either 24 to 36 V DC (PSR3031A) or 48 to 110 V DC (PSR3032A) coach supply voltage and provide 5 V DC output power. The input supply is provided directly from the train battery to the PSR module through a 2W2C D-Sub connector.

The Trainnet® PSR has built-in circuitry to detect and control the input current in the event of a power-up. Controlling the in-rush current prevents component damages.

When input supply voltage is below the minimum value, Trainnet® PSR minimizes current consumption in order to prevent the deep discharge of train batteries.

The Trainnet® PSR module withstands 10 ms input power breaks without disrupting any of the normal operations (Voltage Supply Interruption as per EN50155 Class S2 and Supply change over as per EN50155 Class C1). In case of a longer break in the power supply, the SYSRESET signal is activated to ensure proper shutdown of the systems.

Power Supply Over Ethernet Module (PSE)

MODULE FUNCTIONS
The Trainnet® Power Supply Over Ethernet (PSE) module provides 48 V DC output power to the Trainnet® Ethernet Switching Unit (1U ESU). The Trainnet® PSE enables the Power-over-Ethernet (PoE) functionality of the Trainnet® 1U ESU.

KEY FEATURES
The Trainnet® PSE is used to power up the PoE output on the Trainnet® 1U ESU. In practice, one PSE provides power to 4 Ethernet ports on the 1U ESU. When using two Trainnet® 1U ESU simultaneously, the Trainnet® PSE can provide power to both of them, and provide a total of 8 ports.

The output voltage of the Trainnet® PSE is 48 V DC. The input voltage can be 36-52 V DC (PSE2524A) or 110 V DC (PSE2217B). The Trainnet® PSE can provide a maximum power output of 62 W to be split between the powered ports: for example, 15.4 W for 4 ports or 7 W for 8 ports.

The Trainnet® PSE has built-in circuitry to detect and control the input current in the event of a power-up. Controlling the in-rush current prevents component damages.

When input supply voltage is below the set minimum value, Trainnet® PSE minimizes current consumption in order to prevent the deep discharge of train batteries.

The Trainnet® PSE grace supply function enables the module to continue working for a short period of time when the power is cut off. The PSE module withstands 10 ms input power breaks without disrupting any of the normal operations (Voltage Supply Interruption as per EN50155 Class S2 and Supply change over as per EN50155 Class C1).

The PSE module works only together with the Trainnet® Ethernet Switch Supply (ESS) module which takes power from the train batteries and transfers it to the Trainnet® PSE.

OPTION
Bypass Unit Module
When the external devices requiring PoE consume little power (Class 1, 0.44 - 3.54 W), the Trainnet® PSE Bypass Unit Module (PBU) can be used. The Trainnet® PBU takes power from the PSE module and distributes it to another set of 4 ports (8 if using two 1U ESU modules). Two PBU modules can be used with one PSE module, sharing the PSE’s 62 W between 12 ports of the 1U ESU (up to 24 ports if using a second 1U ESU module).

Trainnet® ESS Module

Trainnet® PBU Module
Rugged Memory Module (RMM)

MODULE FUNCTIONS
The Trainnet® Rugged Memory Module (RMM) is a highly protected memory module to be used as part of a Trainnet® Event Recorder. As the essential part of the Train Event Recorder, it collects and stores vital train-borne information. Depending on your needs, it can record all kinds of data including audio and video recordings.

KEY FEATURES
The Trainnet® Rugged Memory Module is used together with a Trainnet® 3U 84TE Rack and a power supply (usually Trainnet® PSV and Trainnet® PIU modules) to build a fully functional and standalone Event Recorder. The Trainnet® RMM can also be integrated to a larger Trainnet® System, for instance in a 6U 84TE Rack, as an addition to a Gateway, VCU or TCMS.

The Trainnet® Rugged Memory Module (RMM) is meant to be used whenever a high level of data protection is needed. Its crash-proof construction guarantees that the memory board is protected against fire, magnetic fields and any liquids, as well as any mechanical stress during an impact or a continued pressure. In practice, the memory board is embedded in a protected fire insulation block, surrounded by a special steel case that is hermetically sealed.

The design of the Trainnet® Rugged Memory Module fulfills the British (GM/RT2472-1.2002) and European (EEIG 97E461-3.1998) crashworthiness as well as the IEEE (1482.-1.1999) standards.

The Trainnet® RMM can store both analogue and digital signal data. The desired train information can be stored for a predetermined period of time. Data can be retrieved at any time using the Trainnet® TIP Software (Train Inspection Program) which enables system performance analysis and optimization. Data can be copied from the RMM to a USB stick for convenient transport and storage.

The Ethernet and USB ports located on the front of the module can be used to retrieve data from the memory module. The Trainnet® RMM can acquire data from the Ethernet port but also via the VME back plane (thus from added interface modules) and the RS 485 port located on the front panel. The module gets power from the VME back plane.

The RMM can record video streams from onboard digital video recorders (DVR) or directly from cameras. For easy data retrieval, the stream format can be made compatible with your CCTV Software or any other video analysis Software that you use. Alternatively, we can develop customized video analysis tools to fit your needs.

OPTIONS
Memory: Memory can be 2GB or 16 GB.
Front-panel Inprints: Front-panel imprints are available on request in English or any other language of your choice.
GPS/GNSS: A GNSS (Global Navigation Satellite System) receiver can be integrated to the RMM to provide location and time information. One version with GPS+GLONASS and one version with GPS+BeiDou are available. Please note this option will increase the module’s width by 4TE.

TECHNICAL SPECIFICATIONS
Dimensions (W x H x D): 32 TE x 3 U x 160 mm
Weight: 7 Kg
Input Power: 5 V DC ± 5 % (1 A max., 0.5 A typ.)
Temperature Range (operational): -40 °C...+70 °C
MTBF (40 ºC ambient temperature): 890 000 h (2 GB) and 870 000 h (16 GB)
Interfaces
3 or 4 Isolated RS-485
1 x 10/100 Mbit/s Ethernet, M12 connector
1 x USB 2.0 Host for retrieval
Memory: 2 GB or 16 GB

Protection Levels (Rugged Memory Module)
Ingress Protection (IP) rating: 6B
Shock: Up to 100 g / 10 ms and 55 g / 100 ms
Crush: Up to 110 kN for 5 minutes in all axes
Penetration: Up to 23 kg drop from a height of 1,5 m focussed on an area of 30 mm²
Temperature: Up to 700 °C for 5 minutes and 650 °C for 30 minutes followed by 300 °C for 1 hour followed by 100 °C for 5 hours
Chemical Immersion
Winter Diesel (*), Summer Diesel (*), Regular Water (*), Salt Water (*), Lubricating Oil (*), Transformer Oil (*), Hydraulic Oil (*), Anti-Fire Fighting Foam (*), Refrigerant R134A (*), Alcohol (*), Anti-Freeze (*), Battery Acid (*)
(*) minimum for 48 hours   (**) minimum for 60 min
Magnetic Field
Current flow of 64 kA at rising rate of 107 A/s
Hydrostatic pressure
Immersion in salt water at a depth of 15 meter for 48 hours
Standard Racks

FUNCTIONS
Trainnet® Racks are required with every Trainnet® System. Trainnet® modules only work when integrated into a Trainnet® Rack. The Racks enable communication between modules via an integrated IEC 821 VME backplane bus. All modules also take power from the power supply via the backplane.

KEY FEATURES
Trainnet® Racks come in different sizes to fit all needs. While 44TE and 84TE wide racks are commonly used, a 20TE wide rack is also available for smaller systems. When working with a high number of modules or when requiring the 1U ESU module (Power-over-Ethernet), the 6U 84TE can be used. Other rack sizes are also available upon request.

The 3U 44TE and 3U 84TE Racks have different back plane options. Please read the table below for an overview of the possible rack-backplane combinations. The number of free slots for both VME modules (CPUs, bus interface modules and HSA module) and I/O modules (all I/O but HSA) are mentioned. The space required for the power supply is already taken into account.

OPTIONS
Side mounting for 20TE Racks:
The 3U 20TE Racks can be sided mounted as an option, instead of the usual front mounting. Dimensions are then W127 x H133 x D306 mm.

* If using RMM, please note it uses 1 VME slot (leaving 3 out of 4 free)

TECHNICAL SPECIFICATIONS
External Dimensions (W x H x D):
3U 20TE Rack
158 x 133 mm x 215 mm
(Installation width 117 mm)
3U 44TE Rack
280 mm x 133 mm x 215 mm
(Installation width 240 mm)
3U 84TE Rack
483 mm x 133 mm x 215 mm
(Installation width 443 mm)
6U 84TE Rack
483 mm x 266 mm x 215 mm
(Installation width 443 mm)

Weight:
3U 20TE Rack: 1.3 Kg
3U 44TE Rack: 2.3 Kg
3U 84TE Rack: 4 Kg
6U 84TE Rack: 7.3 Kg

Ingress Protection (IP) rating: 20
Flat Racks

FUNCTIONS
Trainnet® Racks are required with every Trainnet® System as Trainnet® modules only work when integrated into a Trainnet® Rack. The Racks enable communication between modules via an integrated IEC 821 VME back plane bus. All modules also take power from the power supply via the back plane.

The Trainnet® Flat Racks are designed to be used in trains where space is limited, for instance trams and light rail vehicles. They are also providing an alternative to Standard Racks dimensions and mounting mechanisms.

KEY FEATURES
Trainnet® Flat Racks come in 3U and 6U format, either as a 12TE or 16TE wide rack. Thanks to their small sizes, Flat Racks can be used in the vicinity of train systems, thus allowing savings by reducing cabling. The Flat Racks have a power supply connector integrated at the back.

The number of free slots for both VME modules (CPUs, bus interface modules and HSA module) and I/O modules (all I/O modules except HSA) are mentioned in the table below. The space required for the power supply is already taken into account. Please note that in the 6U versions, there is no VME bus communication between the two rows of modules.

AVAILABLE VME AND I/O SLOTS IN TRAINNET® RACKS
